HOME TO CANADIANS

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) is Canada's national housing agency.

Backed by over half a century of experience, we work with community organizations, the private sector, non-profit agencies and all levels of government to help create innovative solutions to today's housing challenges, anticipate tomorrow's needs, and improve the quality of life for all Canadians.

CMHC assists Canadians in all parts of the country to access a wide range of innovative and affordable financing choices. Through research, we contribute to the well-being of the housing sector. Working with our provincial, territorial, non-governmental partners and the private sector to deliver the federal government's housing agenda, CMHC helps Canadians from all walks of life access quality, affordable homes. At home and abroad, we work in close collaboration with our government partners and the housing industry to enhance Canada's presence in the global marketplace, and share our housing experience and expertise with the world.

In everything we do, we're committed to helping Canadians access a wide choice of quality, affordable homes, while making vibrant, healthy communities and cities a reality across the country.

A Message from Karen Kinsley, President of Canada Mortgage and Housing Corporation

I am pleased to present the 2005 edition of the *Canadian Housing Observer*. The *Observer* brings together a wide spectrum of housing information to present an integrated overview of the state of Canada's housing along with the key trends and influences. Since its debut in 2003, the *Observer* has become a valuable resource for a broad range of professionals and organizations with an interest in Canada's housing.

There is no doubt that housing matters to Canadians in many ways and for many reasons. More than bricks and mortar—our homes are where we put down roots and build our dreams. Our homes are a source of comfort and stability during life's ups and downs. They provide the stable foundation on which positive outcomes can be achieved for our families and communities in areas as diverse as health, education, employment and economic well-being.

As a generator of jobs and wealth creation, the housing sector adds significant value to the Canadian economy. Expenditures on new construction and renovation, which have reached record levels in recent years, continue to bolster economic growth while creating the homes and communities that underpin our well-being as a nation.

As a major consumer of land, energy and raw materials, the choices we make as housing consumers have broader implications for the environment. As practical solutions are sought to the challenges associated with climate change, the creation of "greener" homes and sustainable communities is becoming a focus for innovation in Canada. Alongside environmental considerations is the recognition of the need to create socially-inclusive communities to accommodate Canada's diverse population.

As with previous issues, the 2005 *Canadian Housing Observer* reviews demographic and socio-economic influences on housing demand, current housing market developments, housing finance trends and housing affordability.

This year's edition of the *Observer* contains a special feature on *Aboriginal housing*, which describes housing conditions and some of the housing challenges currently confronting Aboriginal people. This feature also explores some of the innovative ways that Aboriginal communities are seeking to improve their housing in ways that respect local conditions, the environment and lifestyle and cultural considerations.

A second topic examined in greater depth this year is *Healthy housing and sustainable communities*. This chapter reviews how properly planned and built housing and residential communities can "give back" to the environment and enhance our quality of life.

Most Canadians are well housed, thanks to Canada's housing system. For many, investing in their own home builds financial security for old age. Too many Canadians, however, cannot afford appropriate, decent housing.

That's why Canada Mortgage and Housing Corporation (CMHC) works to make safe, adequate and affordable homes a reality for *all* Canadians. As Canada's national housing agency, our mission is to promote housing quality, affordability and choice. We are committed to ensuring that housing is durable, energy efficient and suited to the needs of Canadians.

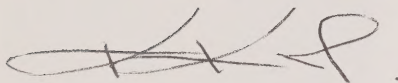

We help lower-income households—seniors, people with disabilities, women and children fleeing family violence, youth at risk, the homeless and those at risk of homelessness—gain access to safe, affordable housing.

We help Aboriginal people improve their housing through new construction, repair of existing homes, and the development of housing markets and the Aboriginal housing sector.

We are committed to ensuring that Canadians have greater access to mortgage financing and an abundant supply of low-cost funds for the residential mortgage market. We encourage innovation in housing design and technology, community planning, housing choice and finance. Through CMHC International, we also help the Canadian housing industry—from service providers to builders and suppliers—to remain competitive.

The creation and sharing of knowledge that supports a better understanding of housing challenges and solutions is important to ensuring ongoing improvements in housing conditions in Canada. This year's edition of the *Canadian Housing Observer* makes an important contribution in this regard. I am confident that you will find it useful.

A handwritten signature in dark ink, appearing to read 'K. Kinsley', with a stylized flourish at the end.

Karen Kinsley
President, CMHC

Healthy Housing and Sustainability	3
Affordability	4

Canada's Housing: Influences on Housing Demand 5

Canada's housing stock: 11.6 million occupied dwellings	5
Almost two-thirds of Canadians own their homes	5
Increasing wealth and changing population mix drives demand	6
Strong labour market continues to support housing	6
Real income growth moderates	7
Recent home equity gains help sustain growth in wealth	8
Population growth unchanged in 2004	9
Housing construction linked to population growth	9
Metropolitan growth is tied to migration and job creation	10
Immigrants drawn to Toronto, Montréal and Vancouver	11
Recent immigrants typically rent, often live in crowded housing	12
Gap between immigrants and non-immigrants shrinks over time	13
Aboriginal housing is often crowded and in poor repair	14
Housing choices shift as people age	15

Current Market Developments19

Housing pulls up overall economic growth	19
Housing exports add to economic growth	20
Existing home market activity begins to slow	20
Seller's market supported strong house price increases in 2004	21
New construction highest since 1987	21
Rising land prices contribute to higher house prices	21

Rising cost of building materials raised construction costs in 2004	22
Shortages of skilled labour, serviced lots concern many builders	23
Continued move to ownership raises rental vacancy rates	24
Rents up moderately	24
Homebuilder retirement plans	24
Additional supply contributes to easing market conditions	25
Secondary rental market large and diverse	26
Gap between cost of owning and renting widens	27
Growth in renovation spending strengthened in 2004	27
More Canadians expect to renovate	28

Housing Finance 31

Strong housing market leads mortgage credit and approvals growth	31
Mortgage payment-to-income ratio near all-time low	31
Mortgage rates make the difference	32
Variable rate mortgages increase in popularity	32
CMHC's <i>Mortgage Consumer Survey</i> and focus group findings	33
Mortgage rates continued to trend downwards	34
Mortgage-backed securities on the rise	34
Medium-term issues remain most common	35
Variable-rate and adjustable-rate MBS	35
Why there is no housing bubble in Canada	36
In 2003, the inflation-adjusted average MLS® price surpassed its previous peak	36
Mortgage rates make the difference	36
No housing bubble for Canada	36

Focus on Aboriginal Housing 37

Introduction	37
Aboriginal population close to one million	37
Aboriginal households total 3.4 per cent of all households	38
Housing conditions outside reserves	39
Definition of Aboriginal population and Aboriginal households	39
Core housing need	39
Core housing need estimates revised	40
Homeownership rates rise	41
Cautions in interpreting changes in areas outside reserves	41
High rate of homelessness	42
On-reserve housing conditions	42
Northern housing conditions	44
Challenges and issues	44
Aboriginal housing challenges outside reserves	44
On-reserve challenges	44

AN OVERVIEW

Canada's Housing: Influences on Housing Demand

- As of the 2001 Census count, there were 11.6 million occupied dwellings in Canada. Two thirds of them were occupied by homeowners.
- Housing demand has been strong since the late nineties. The strength has come from household formation, achieved through growing incomes and employment, rather than population growth, which has slowed in the last 15 years as a result both of low fertility and an aging population. Contributing to the changing population profile is the high level of immigration, and rapid growth in the Aboriginal population.
- In contrast to the early nineties, household income growth (19.7 per cent from 1995 to 2000) was considerably faster than shelter cost growth (11.1 per cent between 1996 and 2001), but high income earners saw their incomes rise much faster than those of low income.
- This growing income gap was reflected in the housing sector where median incomes of homeowners are now approximately double those of renter households. Their consequent greater opportunity of accumulating savings and possessions, and growing home equity resulted in a wide gap between the net worth of owners (\$226,000) and renters (\$14,000) as of 1999.
- The number of immigrants living in Canada increased at more than double the rate of the general population between 1991 and 2000. Immigrants now make up 18 per cent of the Canadian population.

More than 70 per cent of new immigrants come to Toronto, Vancouver or Montreal.

- Less than a third of recent immigrants were owners in 2001 compared with two thirds of non-immigrant households. Six in ten recent immigrant households lived in apartments compared with only a quarter of non-immigrant households, and they have fewer rooms and fewer bedrooms. With their larger family size they are much more likely to be living in crowded conditions. However, the longer immigrants live in Canada, the closer their housing conditions and incomes come to resemble those of non-immigrants.
- Aboriginal households, with incomes 25 per cent lower than those of non-Aboriginal households, experienced low ownership rates and high rates of crowding and disrepair. Aboriginal housing conditions are discussed in more detail in the Focus on Aboriginal Housing chapter of this document.
- From 1991 to 2001, the number of people aged 65 and above grew at more than double the rate of the general population, and this growth rate will continue to accelerate. Just under three quarters of seniors own their homes. Of these, five out of six are mortgage-free.
- The growing seniors population suggests a gradual and modest shift away from single-detached homes to smaller multiple units including condominiums. The shift will be dampened by the fact that pre-retirement seniors (aged 45 to 65) are more likely to switch from renting to owning, and because of the attachment of seniors to their current homes.

Current Market Developments

- 2004 was a strong year for the housing sector. Housing-related spending was up 7.7 per cent in current dollars, compared to growth of 5.7 per cent in the rest of the economy. Construction industry employment grew faster than in any other industry, and exports of housing-related products rose 15 per cent.
- Existing home sales through the Multiple Listing Service (MLS®) grew by 4.8 per cent in 2004, to a record of 456,500 dwellings, and prices rose nearly 10 per cent for the third year in a row.
- Responding to demand, housing starts increased by 6.9 per cent in 2004 to more than 233,400 units, their highest level since 1987. Starts increased in all provinces except New Brunswick, Nova Scotia and Ontario.
- Builders faced rising construction costs and shortfalls in construction labour and skilled tradesmen. Higher prices for wood products and steel were behind the increases in construction costs.
- The movement out of rental accommodation into homeownership continued in 2004, and the average apartment vacancy rate for major urban centres rose from 2.2 to 2.7 per cent. Despite the increase in vacancy rates, rents rose in 2004, with the highest increases being for two-bedroom apartments at 2.3 per cent.
- These rent increases lagged considerably behind the 8.1 percent increases in mortgage carrying cost of a newly purchased existing home (due to higher house prices) and the gap between the cost of renting and owning widened significantly.
- The Canadian rental market includes a variety of living arrangements in addition to conventional rental units. Although there is no direct count, estimates indicate that one third of all rental units in Canada's cities are supplied by what is sometimes referred to as the secondary rental market.
- Owners took advantage of lower mortgage rates to refinance and renovate. Over half the proceeds of refinancing in 2004 were used for renovation-related activity. Spending on alterations and improvements were up 13.6 per cent in 2004.

Housing Finance

- The strong sales and construction activity pushed the total value of mortgage approvals up 17.1 per cent in 2004 compared to 2003. This reflects a 9.8 per cent increase in the number of loan approvals as well as a 6.7 per cent increase in the average loan amount.
- Canadian household debt has risen steadily over the past 30 years and its ratio relative to income has increased to over 100 per cent. However, the mortgage payment-to-income ratio has been near an all-time low for several years. Much of the increase in debt has been used to acquire assets, increasing the net worth of households. In 2004, mortgage debt accounted for 68.7 per cent of total household debt, down from the peak of 74.5 per cent in 1993.
- Mortgage holders are increasingly shopping around when renewing. In 2004, 14 per cent of homeowners switched lenders when renewing their mortgage.
- Lenders have continued to offer discounts ranging from 50 to 150 basis points from their posted mortgage rates (which have been roughly 240 basis points above bond yields in recent years). Mortgage rates in 2004 remained near historic lows, making homeownership financing very affordable.
- NHA Mortgage-Backed Security (MBS) issuance totalled \$30 billion in 2004, an increase of 9.5 per cent over 2003. Of this total, \$19.3 billion was issued for the Canada Mortgage Bonds (CMB) Program, while the remainder was issued directly to investors in the secondary market. At the end of December, total issuance of Mortgage-Backed Securities (MBS) stood at over \$37.7 billion, about 15 per cent higher than in 2003. The outstanding amount of CMB guaranteed by CMHC rose to \$54.5 billion in 2004.
- With mortgage rates trending lower over the last four years, variable-rate mortgages and adjustable rate mortgages have gained considerable popularity with homebuyers. In response, CMHC has expanded the NHA MBS program to include separate pool types for variable rate mortgages and for adjustable rate mortgages.

Aboriginal Housing

- In 2001, there were close to 1 million Aboriginal people in Canada accounting for 3.4 per cent of all households. Of the 398,400 Aboriginal households counted in Canada, close to 20 per cent (73,315) were located on reserves.
- Aboriginal households face tremendous challenges in obtaining adequate housing, including low incomes, unemployment and legal impediments on-reserve.
- In 2001, nearly 24 per cent of Aboriginal households living outside reserves were in core housing need, compared to 13 per cent of non-Aboriginal households. Of some encouragement is the fact that the rate is declining and the gap is narrowing. Aboriginal people are also over-represented in the homeless population.
- On-reserve, the shortfall of dwelling units is estimated to be between 20,000 to 35,000 units. This lack of housing on-reserve has resulted in overcrowding, which accelerates the deterioration of housing and related infrastructure, and affects the health and social well-being of occupants.
- As of 2001, 22.4 per cent of on-reserve Aboriginal households were living in inadequate housing and unable to afford housing in adequate condition. This is over 11 times higher than for non-Aboriginal households.
- Due to high unemployment rates and high construction and operating costs, a large portion of the northern population relies on assisted housing. In 2001, 16.8 percent of Inuit households were in core need and overcrowded, compared to 5.7 per cent of all Aboriginal households.
- Aboriginal women face particular challenges both on and off-reserve. Aboriginal women living outside reserves are more likely to live in lone-parent households than non-Aboriginal females. Almost half (48 per cent) of Aboriginal lone-parent households are in core housing need.
- Women living on-reserve face additional challenges in housing. For example, in marriage dissolution, provincial courts have no authority to award an interest in the matrimonial home, which is usually in the legal possession of the husband or the band. This often results in women having to leave the reserve unless the community has a housing policy for such situations.

- In response to the challenges, Aboriginal groups are innovating in areas such as governance, housing policy development, housing delivery and administration, the encouragement of home-ownership and healthy and sustainable approaches to housing. Examples are presented in the Aboriginal chapter.
- Future directions to address Aboriginal housing challenges are being explored through the Canada Aboriginal Peoples Round Table process which was initiated in April 2004. Housing was one of the six sectors identified for further policy development.
- A key message heard throughout the Roundtable process and echoed at the May 31, 2005 Aboriginal Policy Retreat is the need to increase Aboriginal capacity and control over housing and the need to strengthen relationships among federal, provincial, territorial and Aboriginal partners to work collaboratively on improving Aboriginal housing conditions. The First Ministers Meeting on Aboriginal issues scheduled for November 2005 is a key milestone to working towards this vision.

Healthy Housing and Sustainability

- Housing is a key element of environmental sustainability and quality of life because it is such a heavy consumer of resources in its construction, maintenance and its operation. It also lasts for a long time, affecting energy consuming activities and other key facets of our lives, such as transportation, infrastructure, community, employment, and health.
- In 2003, the residential sector accounted for 17 per cent of Canada's total energy use and 16 per cent of the country's greenhouse gas (GHG) emissions. Total GHGs from all sectors increased by 23 per cent between 1990 and 2003, while increases in residential GHG emissions were somewhat lower, at 15 per cent.
- Several factors can contribute to increases in residential energy use and GHG emissions: seasonal temperature fluctuations, lifestyle, household design and choice of appliances, equipment and dwelling type (structure), the number and size of homes (activity), their integration into the community, and their relationship to the local environment.

- Although the increasing size of Canadian houses decreases the overall efficiency of energy use in the residential sector, energy-efficiency improvements can reduce energy use and GHG emissions. Between 1990 and 2003, the increase in energy use was only 40 per cent of what it would have been without efficiency gains.
- Developments in construction techniques and building materials, and the increasing market share for energy-efficient household appliances have significantly improved the energy efficiency of homes. On average, houses built between 2001 and 2004 use approximately half the amount of energy as those built before 1946.
- Natural Resources Canada's *EnerGuide for Houses* program rates homes on environmental features and gives homeowners specific advice on improving energy efficiency. In 2002-2003, about 48,000 homes in Canada were evaluated. Householders who retrofitted their homes reduced energy consumption by between 20 and 38 per cent and carbon dioxide emissions by an average of four tonnes per year per house.
- CMHC has also developed the Healthy Housing™ concept, based on the principles of occupant health, energy efficiency, resource conservation, environmental impact and affordability. These principles can be applied to all housing forms, styles and price ranges and homes that are appropriately scaled to the occupant's needs are cheaper to own and operate.

Affordability

- In 2001, the average Canadian household spent around one fifth of its before-tax income on housing.
- Seventy per cent of Canadian households lived in affordable uncrowded housing in good repair. Another 16.3 per cent could have obtained acceptable housing at a cost of less than 30 per cent of before-tax household income.
- This left 13.7 per cent of Canadian households living in core housing need, i.e., they were unable to find acceptable housing. This is down from 15.6 per cent in 1996, and was almost as low as the 13.6 per cent level of core need measured in 1991.
- Core need has an income dimension, and of those in the very lowest income bracket (\$10,000 and less), four out of five households were in core housing need.
- Lone-parent, unattached-individual, recent-immigrant and Aboriginal households were all more likely to be in core housing need than other Canadian households.
- Renters are over-represented among those in core housing need. While 28.3 per cent of renters were in core need, the comparable figure for owners was 6.6 per cent. Rental households account for over two thirds of those in core housing need.
- It is evident that households in core need cannot look to accumulated wealth to solve their problems. Based on 1999 data, at most, some 8.1 per cent of owners in core need in 2001 possessed resources that would have enabled them to address their own housing affordability problems. Virtually no renter households in core need had the financial resources to address their own housing problems.

INFLUENCES ON HOUSING DEMAND

Canada's housing stock: 11.6 million occupied dwellings

While new homes are built every year and existing homes renovated or demolished, the total housing stock changes only gradually.

The Census, conducted every five years by Statistics Canada, is the most complete source of information about Canada's housing stock.

This chapter briefly outlines Canada's housing stock and the socio-economic and demographic influences on housing demand.

There were more than 12.5 million residential dwellings in Canada in 2001. However, almost one million were either unoccupied, vacation, or collective dwellings (such as hospitals, school dormitories, residences for senior citizens and institutions), leaving 11.6 million private occupied dwellings, which corresponds to the number of households (see Figure 1).

Almost two-thirds of Canadians own their homes

Most (65.8 per cent) of these private households own their homes. The ownership rate is highest in Newfoundland and Labrador, where 78.2 per cent of households own their homes, compared to only 24.2 per

cent in Nunavut. In rural and small centres,¹ the homeownership rate is significantly higher than the national average, with single-detached dwellings accounting for nearly all the owned dwellings (see Figure 2). In Newfoundland and Labrador, for example, rural and small centres have the highest ownership rate in the country (85 per cent)—and 96 per cent of those homes are single-detached dwellings. In contrast, the

FIGURE 1
TOTAL OCCUPIED DWELLINGS AND OWNERSHIP RATE, CANADA

Source: CMHC (Census-based indicators and data)

ownership rate and prevalence of singles tends to be lower in larger cities, particularly in Quebec. In Montréal, half of all households own their homes and only 60 per cent of these homes are singles.

1 Rural and small centres are those areas outside of Census Metropolitan Areas (CMAs) and Census Agglomerations (CAs). CMAs consist of one or more adjacent municipalities situated around a major urban core with a population of at least 100,000. CAs consist of one or more adjacent municipalities situated around a major urban core with a population of at least 10,000.

FIGURE 2
OWNERSHIP RATES BY DWELLING TYPE,
CANADA AND SELECTED URBAN CENTRES, 2001

Rural and small centres are those settlements with under 10,000 people. Medium-sized centres are settlements with urbanized cores of between 10,000 and 99,999 people. Metropolitan centres are settlements with urbanized cores of 100,000 people or more.

Source: CMHC, adapted from Statistics Canada (Census of Canada)

While the number of occupied dwellings in Canada has almost tripled over the last 40 years, the proportion of singles has remained relatively constant since 1976.

However, the steady share of singles masks changes in tenure, such as the growing ownership rate and the increasing popularity of condominiums, along with regional variations in other housing stock characteristics.²

Increasing wealth and changing population mix drives demand

Beginning in the late 1990s, Canada entered a period of prolonged employment and income growth. Job and income gains, coupled with low mortgage rates and increasing wealth, raised housing demand by bringing an expanded range of housing choices within reach of Canadians.

Although population growth rose moderately at the start of the millennium, no marked acceleration fuelled

recent increases in home building in Canada.³ In fact, over the last decade and a half, population growth in Canada slowed, supported on the one hand by high immigration levels but restrained on the other by falling births and rising deaths as growing numbers of baby boomers entered middle age.

Because growth rates varied considerably across groups, the composition of the general population continued to shift. In particular, the numbers of immigrants, Aboriginal people, and seniors each increased more rapidly than the population as a whole. The housing choices of these and of other Canadians are driven by specific needs and tastes and are subject to financial constraints, which for many recent immigrants and Aboriginal people include low incomes.

Strong labour market continues to support housing

In 1997, job creation and income growth in Canada accelerated, inaugurating a period of rising employment and disposable incomes that extended through 2004 (see Figure 3). Although the pace of job creation over the past four years was not as consistently strong as during the late 1990s, it remained well above that of the first half of the 1990s. In combination with low mortgage rates, this period of increasing employment and disposable incomes raised housing demand—more than countering any drag arising from declining population growth. The income generated by steady employment and the resulting opportunity to build up savings brought additional housing choices within reach of individuals and families by, for example, allowing those sharing accommodation to consider forming their own households.⁴

2 See the *Canadian Housing Observer 2004* "A Portrait of Canada's Housing" for additional details.

3 Housing starts in Canada increased by more than 50 per cent from 2000 to 2004.

4 Sharing can take many forms: living with roommates, renting to boarders, or moving in with family members.

FIGURE 3
JOB CREATION AND REAL DISPOSABLE INCOME GROWTH,
CANADA, 1990-2004

Full-time positions accounted for all the job gains in 2004. Throughout the year, both the rate of participation in the labour force and the employment rate—the percentage of the population with jobs—were at or near record levels. The unemployment rate dropped to 7.2 per cent, matching the rate in 2001.

Real income growth moderates

With job creation accelerating, average before-tax incomes of Canadian households grew three times faster from 1995 to 2000 than during the preceding five years. In contrast to the early 1990s, when average shelter costs increased faster than average incomes, income growth in the late 1990s surpassed increases in shelter costs. Average

household incomes rose 19.7 per cent from 1995 to 2000, while shelter costs increased just 11.1 per cent between 1996 and 2001.⁵ The largest income gains were in urban centres in Alberta and southern Ontario, the regions with the strongest employment growth.

The somewhat lower rate of job creation in recent years has likely dampened household income growth since 2000. Growth in real disposable incomes, which tends to parallel household incomes, accelerated in the late 1990s and then slowed (see Figure 3).

Real household incomes did not fully recover from declines in the early 1990s until late in the decade. From 1990 to 2003, the median real after-tax income of Canadian households rose 1.9 per cent.⁶ Real after-tax incomes of owner households increased 3.6 per cent, but those of renters fell 4.2 per cent.

One factor that curbed growth in the real incomes of renters was the movement in the late 1990s of large numbers of households out of rental units into homeownership. This is because the renters who bought homes typically had higher incomes than households that continued to rent.⁷

High-income earners enjoyed much stronger income growth than those with low incomes. From 1990 to 2003, the average real after-tax income of the bottom fifth of households declined 1.2 per cent, while that of the top fifth rose 14.8 per cent (see Figure 4).

5 Data are not adjusted for inflation. Reference dates for income and shelter cost data collected by the Census differ. Income data refer to the calendar year preceding the Census, while shelter cost data gives expenses for the Census year. Data exclude farm, band and reserve households; households with incomes of zero or less and households whose shelter costs equal or exceed their incomes. For renters, shelter costs include rent and payments for electricity, fuel, water and municipal services that are not included in the rent. For owners, shelter costs include mortgage payments (principal and interest), property taxes and condominium fees, along with payments for electricity, fuel, water and municipal services.

6 All income data referenced in this and the following paragraph are from custom tabulations that combine data from the *Survey of Consumer Finances* (for 1990 through 1995) and the *Survey of Labour and Income Dynamics* (for 1996 through 2002).

7 In 2002, homeowners who had moved from rental homes within the previous six years had median household incomes that were more than double the incomes of households who rented throughout the same six-year period (Statistics Canada—*Survey of Household Spending*).

Recent home equity gains help sustain growth in wealth

Take-home pay is one source of funds that households can use to acquire housing, but not the only one. Households can also tap savings—if they have any—to cover rent, mortgage payments and other expenses. Wealth in the form of cash savings or other liquid assets can allow households to weather layoffs, illnesses and other interruptions to their incomes.

In 1999, the median net worth of households in Canada was about \$124,000.⁸ On a regional basis, net worth was highest (\$157,000) in British Columbia and lowest (\$70,000) in Newfoundland and Labrador (see Figure 5). Differences in home equity accounted for some—but by no means all—of the differences in net worth across provinces. While home equity was relatively high in Ontario, Alberta, and British Columbia—the provinces with the highest housing prices in Canada—so, too, were holdings of other assets.

Net worth typically accumulates during employment and is drawn down during retirement. In 1999, the median net worth of households whose major income

earner was aged 55 to 64 (\$283,000), was seven times that of households maintained by those between 25 and 34 (\$41,000) and more than 45 times that of households maintained by those under 25 (\$6,000).

As a group, owners are much wealthier than renters. In 1999, the median net worth of owner households was \$226,000, that of renters just \$14,000. The imbalance was not simply a matter of owners being older—differences in net worth were still substantial for owners and renters within the same age groups.

Judging from their current incomes, the large difference in the net worth of owners and renters is probably a consequence of lifetime income differences.⁹ Owners are likely to have earned relatively high incomes over extended periods, allowing them to accumulate other assets as well as equity in their homes. Median incomes of owner households in 1999 were approximately double those of renters of similar age. Home equity accounted for 29 per cent of the net worth of homeowners.¹⁰

From 1984 to 1999, the real median net worth of households rose by about ten per cent. During this period, disparities in the wealth of owners and renters widened. The real median net worth of owners rose over 20 per cent, while that of renters dropped more than 40 per cent. This divergence is consistent with the previously discussed direction of income changes during the 1990s.

National accounts data suggest that the real net worth of Canadian households has grown since 1999 but at a slower rate than during the 1990s. In the last few years, stock markets have been volatile, while house prices have accelerated.

As a result, after falling through much of the 1990s, residential structures and land have grown as a proportion of the assets of persons and unincorporated businesses. It is likely therefore, that home equity now represents a larger share of household net worth than it did in 1999.

8 The last comprehensive survey of wealth in Canada, the *Survey of Financial Security*, was conducted in 1999. Net worth is the difference between a household's assets and liabilities. Assets include the value of registered pension plans.

9 It is not just current income but income over a lifetime—so-called permanent income—that is used to build net worth.

10 The proportion rises to 36 per cent if the value of registered pension plans is excluded from net worth.

FIGURE 5

MEDIAN NET WORTH, CANADA AND PROVINCES, 1999

the second year in a row, after briefly rising above that mark in 2001 and 2002.¹¹ Net international migration accounted for two-thirds of growth in 2004, a sharp contrast to the first half of the 1990s when natural increase contributed the dominant share. With natural increase set to decline further as Canada's baby boomers age, the proportion of growth attributable to immigration is likely to rise in coming years.

Housing construction linked to population growth

Although no significant increase in population growth occurred in conjunction with the recent run-up in homebuilding in Canada, it is a mistake to conclude that there is no connection between housing demand and population growth. People are the raw material from which households form, and growth in the number of households is a key source of housing demand.

Marked differences in population growth underlie variations in the rate of housing construction from city

Population growth unchanged in 2004

Over the last decade and a half, the pace of population growth slowed gradually in Canada (see Figure 6). Two factors helped limit growth: low fertility and an aging population.

For years, the number of births per woman has been below the level required for each generation to replace itself.¹¹ Baby boomers, the large generation born in the two decades following the Second World War, now range in age from about 40 to 60. As baby boomers moved progressively into middle age during the 1990s, births fell and deaths rose steadily.

Between 1990 and 2004, natural increase—the difference between births and deaths—dropped by more than half.¹²

In 2004, population growth remained below one per cent for

FIGURE 6

COMPONENTS OF POPULATION GROWTH, CANADA, 1990-2004

Data are for 12-month period ending on June 30 of stated year
 Net migration is the difference between population growth and natural increase

Source: CMHC, adapted from Statistics Canada (CANSIM 11)

11 In 2003, the total fertility rate in Canada was 1.53 births per woman, far below the so-called replacement rate of 2.1.

12 Natural increase describes how much a population would grow in the absence of migration.

13 All data on population growth, natural increase and migration are for the 12 months before July 1 of the year under discussion.

to city. Though the relationship is complicated by other factors, including housing costs and the state of local economies, urban centres with relatively high rates of population growth generally account for a disproportionate share of homes built.

From 1996 to 2004, for example, the per capita rate of homebuilding in Calgary, the fastest-growing metropolitan area in Canada during the period, was many times higher than in shrinking Census Metropolitan Areas (CMAs) like Greater Sudbury, Thunder Bay and Saguenay (see Figure 7). Vancouver, Edmonton, Toronto, Ottawa-Gatineau, and a number of other urban centres in southern Ontario also had strong population growth and high construction volumes.

Though centres in Ontario, Alberta, and British Columbia still led the growth rankings, the distribution of metropolitan population growth was moderately more even in the period from 2001 to 2004 than during the previous half decade. Growth slowed somewhat in Calgary, Edmonton, Vancouver, Ottawa-Gatineau

and a number of southern Ontario centres, including Hamilton, and rose modestly in many metropolitan areas in other parts of Canada, including Montréal, Québec City and Winnipeg (see Figure 8). Fed by within-province migration, much of it likely from nearby Toronto, Oshawa was the fastest-growing CMA in Canada from 2001 to 2004, followed by Toronto and Calgary.

Metropolitan growth is tied to migration and job creation

Large differences in metropolitan population growth rates primarily reflect the impacts of migration. Cities grow rapidly because people move to them. Slow-growing or declining centres typically lose population through out-

migration. Migration will remain the key determinant of metropolitan growth since all major urban centres in Canada face—to varying degrees—the prospect of aging populations. In a few, deaths already outnumber births.¹⁴

Source: CMHC, adapted from Statistics Canada (CANSIM II)

From 1996 to 2004, populations in six metropolitan areas—Greater Sudbury, Saguenay, Thunder Bay, Saint John, Trois-Rivières and Regina—fell.¹⁵ In each, the number of residents moving to other parts of Canada outnumbered those arriving from elsewhere in Canada.

Many metropolitan areas with above-average population growth, such as Calgary, Edmonton and Ottawa-Gatineau, attract migrants both from within Canada and from abroad (see Figure 9). Migration patterns are very different for Montréal, Toronto and Vancouver. They lose population to other parts of Canada, but losses are more than offset by the arrival of large numbers of immigrants.

One reason people move is to take up new jobs or to find a job. Metropolitan areas with consistently high population growth

rates tend to have relatively strong job gains. Since the mid-1990s, centres with both strong population growth and robust job creation, led by Calgary, have been concentrated in Alberta and southern Ontario (see Figure 10).

Immigrants drawn to Toronto, Montréal and Vancouver

More than 70 per cent of new immigrants to Canada come to Toronto, Vancouver or Montréal—over 40 per cent to Toronto alone. Over the past two decades, the likelihood of an immigrant settling in one of these three centres has increased.¹⁷ Although some immigrants move from Toronto and Montréal to other centres in the years following their arrival in Canada, such is not the case for Vancouver, which subsequently attracts additional immigrants from the rest of Canada.

FIGURE 10
POPULATION AND EMPLOYMENT GROWTH

Source: CMHC, adapted from Statistics Canada (CANSIM II)

15 All but Greater Sudbury and Saguenay recorded modest growth towards the end of the period.

16 As with population growth, employment growth in most urban centres in Alberta and southern Ontario slowed in recent years.

17 Feng Hou and Larry S. Bourne, *Population movement into and out of Canada's immigrant gateway cities: A comparative study of Toronto, Montreal and Vancouver*, Analytical Studies Branch research paper series Catalogue no. 11F0019MIE - No. 229 (Ottawa: Statistics Canada 2004), p.5. In 1981, almost 60 per cent of immigrants who arrived in Canada in the previous 10 years came to Toronto, Vancouver or Montréal. In 2001, by comparison, these three metropolitan areas were home to nearly three-quarters of immigrants from the previous decade.

18 Hou and Bourne, pp. 16-17. Although Toronto experienced a net loss of immigrants to other locations in Canada from 1976 to 2001, it gained university-educated immigrants. In comparison, out-migration of immigrants from Montréal affected all education classes.

FIGURE 11
OWNERSHIP RATES, IMMIGRANT AND NON-IMMIGRANT
HOUSEHOLDS, CANADA, 2001

Year of arrival describes the period during which the primary household maintainer landed in Canada.
Recent refers to household maintainers arriving in Canada between 1996 and May 15, 2001.

Source: CMHC, adapted from Statistics Canada (Census of Canada)

From 1991 to 2000, 2.2 million immigrants settled in Canada, the highest intake of any decade in the 20th century.¹⁹ As a result of this influx, the number of immigrants living in Canada increased at more than double the rate of the general population. So far, in the decade beginning with 2001, arrivals are on pace to surpass the 1991–2000 total.

In 2001, immigrants made up 18 per cent of the population of Canada, the highest proportion in 70 years.²⁰ In Toronto the proportion was 44 per cent; in Vancouver, 38 per cent—considerably higher than in major traditional immigrant destination cities in the United States, Australia or Europe. Only Miami comes close.²¹

For immigrants, the presence of family members or friends is the most important reason for choosing a particular destination.²² Job prospects, though also important, come second. Large immigrant populations in places like Toronto, Vancouver, and Montréal therefore tend to encourage further immigration to these cities, one reason why they continue to attract the bulk of newcomers to Canada.

Recent immigrants typically rent, often live in crowded housing

By comparison to non-immigrants, the housing occupied by recent immigrants is relatively modest, with two-thirds living in multiple-unit rentals. In 2001, less than a third of recent-immigrant households were owners, compared to two-thirds of non-immigrants (see Figure 11).²³ Six in ten recent-immigrant households lived in apartments, and just over one in five lived in single-detached houses.²⁴ With six in ten non-immigrant households living in detached homes and only a quarter in apartments, the dwelling types of non-immigrants in 2001 were virtually the reverse of those of recent immigrants.²⁵

Concentrated as they are in apartments, the homes of recent immigrants have fewer rooms overall and fewer bedrooms than those of non-immigrants. Since recent-immigrant households are significantly larger than non-immigrant households—an average of 3.2 persons in 2001 compared to 2.5 for non-immigrants—a high percentage of these smaller homes are crowded.

19 Hou and Bourne, p. 5.

20 Statistics Canada, *2001 Census: analysis series Canada's ethnocultural portrait: The changing mosaic*, Statistics Canada Catalogue no. 96F0030XIE2001008 (Ottawa: Statistics Canada, 2003), p. 5.

21 Hou and Bourne, p. 9. The paper notes that the percentage of immigrants in the population of Toronto is higher than in Miami, Los Angeles, New York City, Sydney, Paris and London. Only the percentage in Miami (40 per cent) approaches that of Toronto.

22 Statistics Canada, *Longitudinal survey of immigrants to Canada: Process, progress and prospects*, Catalogue no. 89-611 XIE (Ottawa: Statistics Canada, 2003), pp. 13-15.

23 Household definitions underlying the discussion of immigrants in this chapter are derived from Census concepts. Immigrant households are households whose primary maintainers are immigrants to Canada. In 2001, recent-immigrant households were those whose primary maintainers came to Canada from 1996 through May 15, 2001 (Census Day). The primary household maintainer is the first person in the household listed on the Census form as being responsible for major household payments, such as rent or mortgage.

24 Virtually all of the remaining 17 per cent of recent immigrant households who did not live in apartments or single-detached houses lived in other types of multiple dwellings such as semi-detached, duplex or row units.

25 One reason for the differences in dwelling choices is that non-immigrants tend to be older than recent immigrants.

FIGURE 12

CROWDED HOUSING, IMMIGRANT AND NON-IMMIGRANT HOUSEHOLDS, CANADA, 2001

CMHC assesses crowding using the National Occupancy Standard, a measure that is sensitive to both household size and the relationships among household members.

Year of arrival describes the period during which the primary household maintainer landed in Canada.

Recent refers to household maintainers arriving in Canada between 1996 and May 15, 2001.

Source: CMHC, adapted from Statistics Canada (Census of Canada)

Over a third of recent-immigrant households lived in crowded homes in 2001, compared to just four per cent of non-immigrant households (see Figure 12). Among renters, the rate of crowding for recent immigrants was even higher—over 40 per cent.

Income differences play a role in the housing choices of immigrants and non-immigrants. In 2000, the median income of recent-immigrant households was two-thirds that of non-immigrant households (see Figure 13).²⁶ Recent-immigrant households spent relatively high proportions of their low incomes on shelter—31 per cent

on average in 2001 compared to 21 per cent for non-immigrants.²⁷ It is likely then that some recent immigrants share living space or settle for smaller housing than they would otherwise prefer in order to reduce expenses.²⁸ Lack of rental housing suited to families may also constrain the choices of recent immigrants.²⁹

Even the recent immigrants who were homeowners in 2001 tended to choose relatively affordable ownership options. For example, one-quarter lived in condominiums, more than three times the percentage of non-immigrant owners in condominiums.³⁰

Gulf between immigrants and non-immigrants shrinks over time

The longer immigrants live in Canada, the more their housing and incomes come to resemble those of non-immigrants. In 2001, for example, the rate of crowding among immigrant households declined progressively with years of residence in Canada (see Figure 12). The same pattern of shrinking differences between immigrant and non-immigrant households held for ownership rates and incomes (see Figures 11 and 13). In fact, in many metropolitan areas, the household incomes and ownership rates of immigrants who had been in Canada more than 15 years (since at least 1985) surpassed those of non-immigrants.³¹

26 Income data collected by the Census of Canada refer to the previous calendar year. Data from the 2001 Census describe incomes in 2000.

27 Shelter cost-to-income calculations apply only to non-farm, non-band, non-reserve households with incomes greater than zero and shelter costs equal to less than 100 per cent of their incomes. All other statistics discussed with respect to immigrant and non-immigrant households are derived from data for all households in Canada.

28 Although the relatively large size of recent-immigrant households may reflect a preference for living in extended families, it is likely that it also reflects costs or a lack of available homes with enough bedrooms for extended or multiple families. Compared to non-immigrants, recent immigrants in 2001 were more than twice as likely to share housing with relatives other than their immediate families and four times as likely to live in households comprising two or more families.

29 Lapointe Consulting Inc. with Robert A. Murdie, *Immigrants and the Canadian housing market: Living arrangements, housing characteristics, and preferences*, (Ottawa: Canada Mortgage and Housing Corporation, 1996), p.8.

30 Around 80 per cent of non-immigrant owners lived in single-detached homes, compared to less than 60 per cent of recent-immigrant owners. Some, but not all, of this difference reflects the concentration of immigrants in large urban centres with relatively high proportions of multiple-unit dwellings in their housing.

31 One reason for the relatively high incomes and ownership rates of these immigrants is that they are generally older than other immigrants.

FIGURE 13
MEDIAN INCOMES, IMMIGRANT AND NON-IMMIGRANT
HOUSEHOLDS, CANADA, 2000

These patterns suggest that differences with respect to income and housing between the current generation of recent immigrants and non-immigrants are likely to narrow or even disappear over time. The extent to which differences diminish remains to be seen, however, since each generation of newcomers has distinct characteristics and faces a different set of economic circumstances upon arrival in Canada.

One obvious change over time in the characteristics of immigrants is that newcomers to Canada nowadays come predominantly from Asia and other non-European regions, rather than Europe. In some respects at least, the current generation of recent immigrants has more ground to make up on non-immigrants than previous generations: in 2001, recent immigrants had slightly lower household incomes and ownership rates than their counterparts in 1991.³²

Aboriginal housing is often crowded and in poor repair

Like immigrants, Aboriginal people—who represent about three per cent of the national population—are a rapidly growing subpopulation. Growth from 1996 to 2001 was more than five times the rate for the Canadian population overall. A youthful age profile and high fertility are factors behind the strong growth.³³ In 2001, half of Aboriginal people were under the age of 25 compared to about a third of non-Aboriginal people.

Certain parts of Canada, especially the North and the Prairies, have high concentrations of Aboriginal people. In 2001, Aboriginal people made up 85 per cent of the population of Nunavut, 51 per cent of the Northwest Territories, 23 per cent of Yukon, 14 per cent of Manitoba and 14 per cent of Saskatchewan. In urban areas, concentrations were highest in Saskatoon (nine per cent), Winnipeg and Regina (eight per cent each) and Thunder Bay (seven per cent). Only about a third of all Aboriginal people lived in metropolitan areas, compared to two-thirds of non-Aboriginals.

In 2000, the median income of Aboriginal households was 25 per cent lower than that of non-Aboriginal households (*see Figure 14*).³⁴ The disparity was much wider in metropolitan areas with relatively high concentrations of Aboriginal people and in the Territories.

32 In 2001, 30.4 per cent of recent-immigrant households owned their homes, compared to 31.1 per cent in 1991. Inflation-adjusted median household incomes of recent immigrants in 2000 were about four per cent lower than in 1990.

33 Demographic factors are thought to have accounted for about half this growth, increased awareness of Aboriginal roots and more complete enumeration of reserves for the other half. Statistics Canada, 2001 *Census: analysis series Aboriginal peoples of Canada: A demographic profile*, Statistics Canada Catalogue no. 96F0030XIE2001007 (Ottawa: Statistics Canada, 2003), p. 6.

34 Aboriginal households, defined on the basis of self-identity from the 2001 Census, include any family household in which at least one spouse, common-law partner or lone parent self-identified as Aboriginal; or at least 50 per cent of household members self-identified as Aboriginal; and any non-family household in which at least 50 per cent of the household members self-identified as Aboriginal.

MEDIAN INCOMES, ABORIGINAL AND NON-ABORIGINAL HOUSEHOLDS, CANADA, TERRITORIES, AND SELECTED URBAN CENTRES, 2000

Median household incomes (thousands)

Aboriginal households include any family household in which at least one spouse, common-law partner, or lone parent self-identified as Aboriginal, or at least 50 per cent of household members self-identified as Aboriginal; and any non-family household in which at least 50 per cent of the household members self-identified as Aboriginal.

Source: CMHC, adapted from Statistics Canada (CANSIM II)

In Nunavut, median incomes of Aboriginal households were less than half those of non-Aboriginals.

The relatively low incomes of Aboriginal households find expression in low ownership rates and high rates of crowding and disrepair (see Figure 15). In 2001, under half (44.6 per cent) of Aboriginal households were homeowners, compared to two-thirds of non-Aboriginal households.³⁵ One in seven Aboriginal households lived in crowded housing, more than double the rate for non-Aboriginals. One in five Aboriginal households lived in dwellings that were in need of major repair, two-and-a-half times the rate of disrepair for homes of non-Aboriginals.³⁶

Crowding and disrepair are especially widespread in communities on reserves. In 2001, 40 per cent of Aboriginal households living in band housing resided in dwellings that needed major repairs, while around a quarter lived in crowded homes. These crowded Aboriginal households in band housing were very

large—an average of 6.2 persons—well above the average size of all Aboriginal households (3.1) and of non-Aboriginal households (2.5).

Housing choices shift as people age

Seniors are another fast-growing segment of the Canadian population. From 1991 to 2001, the number of people aged 65 or more in Canada increased at more than double the rate of the general population. Growth of this group will accelerate up to and beyond 2011 when the first baby boomers turn 65.

Although their incomes are lower than those of working-age households, many seniors have substantial equity in their homes. In 2001, 71.2 per cent of senior households owned their homes, five out of six of them mortgage-free.³⁷ Nearly a

FIGURE 15

OWNERSHIP, CROWDING AND DISREPAIR, ABORIGINAL AND NON-ABORIGINAL HOUSEHOLDS, CANADA, 2001

Aboriginal households include any family household in which at least one spouse, common-law partner, or lone parent self-identified as Aboriginal, or at least 50 per cent of household member self-identified as Aboriginal, and any non-family household in which at least 50 per cent of the household members self-identified as Aboriginal.

Source: CMHC, adapted from Statistics Canada (Census of Canada)

³⁵ Although the fact that Aboriginal people are younger on average than non-Aboriginals accounts for some of the difference in ownership rates, the percentage of Aboriginal households owning their homes was lower than that of non-Aboriginals at every age.

³⁶ Major repairs include such items as defective plumbing or wiring; and walls, floors, or ceilings requiring structural repairs.

³⁷ Senior households are households whose primary maintainers are 65 or older. The primary household maintainer is the first person in the household listed on the Census form as being responsible for major household payments, such as rent or mortgage.

FIGURE 16
OWNERSHIP RATES, SENIOR AND NON-SENIOR HOUSEHOLDS,
CANADA, 1971-2001

Age groups refer to the age of the primary household maintainer, the person responsible for major household payments, such as mortgage or rent.

Source: CMHC, adapted from Statistics Canada (Census of Canada)

quarter of senior owners were individuals living alone in detached houses—many of them widowed and almost all of them mortgage-free.³⁸ In 1999, the median net worth of senior owners who did not have a mortgage was \$310,000.

After dropping in the 1970s, the rate of homeownership among seniors rose substantially from 1981 to 2001, much more so than the rate for non-seniors (see Figure 16). Growth of ownership housing options that appeal to seniors, such as condominiums, likely played a role in the strength of this increase. The number of owner-occupied condominiums in Canada almost quadrupled between 1981 and 2001.³⁹ In 2001, almost a third of condominium owners were households led by seniors.

It will be 25 years before the youngest of the baby boomers turns 65. As this demographic transition plays out, housing choices will shift, and household moves will reflect this changing demographic.

Every year, millions of Canadians move. Although young adults are by far the most mobile group, older Canadians are also mobile. In 2002, approximately a third of households led by 45- to 64-year-olds and 20 per cent of senior households had moved at least once in the previous six years.⁴⁰

From 1997 to 2002, the number of senior households moving from owning to renting was more than double the number moving from renting to owning (see Figure 17). In 2002, senior households who moved in the past six

years were split almost evenly between those who owned and those who rented their previous dwellings.⁴¹ Of those who owned their previous homes, 60 per cent purchased again, while over 80 per cent of movers who had been renters continued to rent. Condominiums were chosen by one in eight senior movers.⁴²

Far more senior households moved away from single-detached houses than moved to detached homes from other dwelling types. A minority—close to 40 per cent—of senior movers who previously lived in single-detached dwellings moved to another detached home. Of this group, around 70 per cent moved to a house with only one floor. In contrast, the majority (80 per cent) of senior households leaving an apartment moved to another apartment.

38 In 2001, 90 per cent of seniors living alone in single-detached houses that they owned did not have a mortgage.

39 The Census of Canada does not identify condominium units occupied by renters.

40 Mobility data are from Statistics Canada's 2002 *Survey of Household Spending*. Households considered to have moved are ones who moved in the previous six years. The *Survey of Household Spending* collects information about the most recent move of the household reference person, but not about any other moves the person may have made during the six-year period. The reference person (maintainer) is the person or one of the people in the household responsible for major household payments (such as rent or mortgage).

41 A small proportion of household maintainers (reference people) who moved in the last six years did not maintain their previous dwelling; for example, they might have lived with relatives or friends who owned or rented the dwelling.

42 Just over 10 per cent of those who moved to condominium developments rented their new homes.

FIGURE 17

TENURE CHANGES BY AGE GROUP, CANADA, 1997-2002

Households considered to have moved are ones who moved in the previous six years (from 1997 through 2002). Data describe only the most recent moves of households.

Source: CMHC, adapted from Statistics Canada (Survey of Household Spending)

Compared to senior households, pre-retirement households—those with maintainers aged 45 to 64—were more likely to switch from renting to owning when they moved. The number switching from renting to owning was more than double the number switching from owning to renting. In 2002, 40 per cent of pre-retirement households who moved out of rental units in the previous six years bought homes. In addition, three-quarters of pre-retirement movers who owned their previous homes purchased another. One in ten pre-retirement households who moved opted for a condominium.

Moves by pre-retirement households produced only a slight shift away from single-detached homes towards multiple dwellings. In contrast to seniors, who tended to occupy other dwelling types after leaving detached homes, a majority (about 60 per cent) of pre-retirement movers who left a single-detached house moved to another detached home.

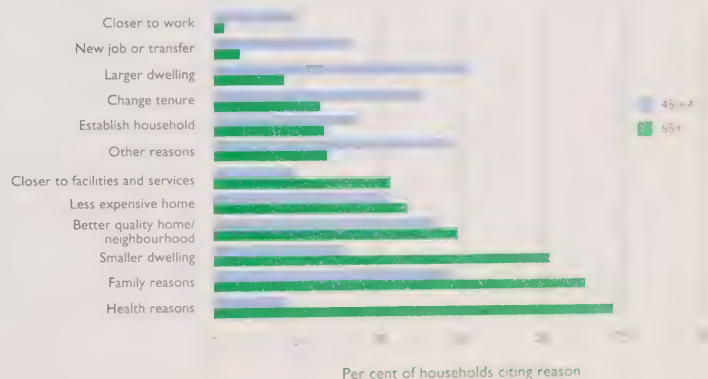

These mobility patterns suggest that a gradual and modest shift away from single-detached homes towards smaller multiple dwellings, including condominiums and rental units, will occur as the baby boomers approach and then enter their retirement years. One factor limiting the extent of change is the attachment of seniors to their current homes. Around 80 per cent of senior households in 2002 (comprised of both owners and renters) had not moved at all in the previous six years. Senior homeowners were even less inclined to move: only one in nine had moved in the previous six years.

For some seniors, there may be an involuntary aspect to moving. Changing residence may become necessary to cope with diminished physical capabilities, declining health, or the death of a spouse. In 2002, the three reasons most commonly given by seniors for moving out of their previous dwellings were health, followed by family and the need or desire for a smaller dwelling (see Figure 18).⁴³ In contrast, pre-

retirement households showed more interest in increasing their living space. They cited needing or wanting a larger dwelling, family reasons, and wanting a better quality dwelling or neighbourhood as their top three reasons for moving.

FIGURE 18

REASONS FOR MOVING BY AGE GROUP, CANADA, 1997-2002

Percentages do not total 100 since households were allowed to give more than one reason for moving. Age describes the household reference person (maintainer).

Source: CMHC, adapted from Statistics Canada (Survey of Household Spending)

43 Respondents to the 2002 *Survey of Household Spending* were allowed to give multiple reasons for moving. The questionnaire provided four examples of family reasons (birth, death, marriage or divorce).

DEVELOPMENTS

The Canadian housing market turned in another strong performance in 2004. About 456,500 existing homes changed hands through the Multiple Listing Service (MLS®) system, more than at any time in the past. Housing starts reached 233,400 units, the highest in 17 years.

Spending on renovations grew by an estimated 13 per cent, a pace exceeded only twice in the past 25 years—in 2001 and 1983.

Rising homeownership contributed to the increase in the rental vacancy rate, with the average for 28 major urban centres across the country reaching 2.7 per cent, compared to 2.2 per cent in 2003.

The strong performance of the housing market in 2004 reflected favourable economic trends, such as robust employment growth and low mortgage rates.

Housing pulls up overall economic growth

Housing-related spending contributes significantly to economic growth. Spending grew at a rate of 7.7 per cent in current dollars in 2004, compared to growth of 5.7 per cent in the rest of the economy. In 2004, employment in the construction industry as a whole grew faster than in any other industry and accounted for close to a third of the increase in total employment.

FIGURE 19
NEW CONSTRUCTION HALF OF HOUSING RELATED INVESTMENT, 2004

Housing-related spending in GDP, Canada, 2004

Source: CMHC, adapted from Statistics Canada (National Accounts)

Housing-related spending accounts for just under one-fifth of total economic activity in Canada. This includes ongoing consumption expenditures on items such as mortgage interest, property taxes, heating, electricity and water, insurance and maintenance, which represent about two-thirds of total spending.

Housing-related spending (*see Figure 19*) also includes investments by households, such as renovations⁴⁴ that improve the condition of their housing, the construction of new housing⁴⁵ and fees associated with the purchase of existing homes.⁴⁶ Housing-related investments

44 Most home repairs that do not increase the value of the home are excluded from major renovations and included in housing-related consumption.

45 Includes the value of the house but not the land. Acquisition costs such as land development charges, legal fees and permits are also included.

46 These fees include real estate commissions, land transfer taxes, appraisals and legal fees.

FIGURE 20

GROWTH IN HOUSING EXPORTS, CANADA, 2001-2004

Housing exports include only products which embody significant amounts of processing. Semi-processed lumber is excluded.

Source: CMHC, adapted from Statistics Canada (custom tabulations)

collectively represent about one-third of all housing-related spending. New construction accounts for about half of this investment spending, renovations about a third, while fees associated with existing home purchases account for the remainder (see Figure 19).

Housing-related spending contributed \$245 billion to the Canadian economy in 2004. Consumption, at about \$162 billion, represented roughly 66 per cent of this total.

Housing exports add to economic growth

Canada sells a variety of construction materials to other countries. Therefore, a rise in housing-related spending in other countries can result in higher demand for Canadian-made construction materials, which contributes to economic growth in Canada. In 2004, exports of value-added, housing-related products reached \$10.1 billion, up 15 per cent from the previous year (see Figure 20). This represents around 2.5 per cent of total Canadian merchandise exports of \$412 billion.

Processed wood products continued to show the strongest growth. Most other product categories were up as

well, with metal and machinery products turning in particularly strong performances in 2004.

Ontario and Quebec accounted for more than 60 per cent of the exports of all housing-related building products. The main destination for Canadian exports was the U.S., with a 94 per cent share of the total. Japan was the second largest market (with a two per cent share), while the United Kingdom, China and Germany accounted for a combined share of about one per cent.

Existing home market activity begins to slow

In 2004, growth of existing home sales through MLS® accelerated slightly to 4.8 per cent, bringing sales to a record of 456,500 dwellings (see Figure 21). However, sales of existing homes showed signs that they had reached a peak in 2004.

Seasonally adjusted monthly MLS® sales rose sharply in the first quarter of 2004, reaching just over 41,000 units in March. Since then, MLS® sales have trended lower. MLS® sales in Ontario, which accounted for 43 per cent of national sales in 2004, displayed a similar pattern.

MLS® sales increased in all provinces in 2004 except Nova Scotia and Quebec, where sales were down 3.8 per cent in each province.

FIGURE 21

NEW LISTINGS UP FASTER THAN SALES

Annual Sales, New Listings, Canada, 1992-2004.

FIGURE 22
SELLER'S MARKET CONDITIONS PERSIST

Seasonally-adjusted monthly sales-to-new-listings ratio, average MLS* price, Canada, 1988-2004

Source: CMHC, adapted from Canadian Real Estate Association (Multiple Listing Service®)

National new listings grew at a significantly faster rate than sales in both 2003 and 2004. New listings grew in all provinces in 2004 except Prince Edward Island, where they declined by nine per cent. With new listings rising more rapidly than sales, the existing home market is moving toward more balanced conditions.

Seller's market supported strong house price increases in 2004

The sales-to-new-listings ratio is an indicator of the relative balance between demand and supply in the existing home market. As new listings increase relative to sales, buyers can be more selective when making a purchase and typically have more bargaining power. For Canada as a whole, a ratio between 0.35 and 0.50 is associated with a balanced market and modest growth in prices. Ratios above 0.50 are associated with more rapidly rising prices—a “seller’s market.”

With new listings rising faster than sales, the national sales-to-new-listings ratio has been on a downward trend since its peak in 2002. However, it remained well within seller’s market territory and prices rose nearly 10 per cent for the third year in a row (see Figure 22).

The threshold for classifying local market conditions as balanced or seller’s markets using the sales-to-new-listings ratio varies from centre to centre. Nevertheless, in all major urban centres the ratio remained above 0.50 in 2004 and house prices continued to rise.

New construction highest since 1987

Housing starts increased by 6.9 per cent in 2004 to more than 233,400 units, their highest level since 1987. Starts increased in all provinces except New Brunswick, Nova Scotia and Ontario. In Montréal and Vancouver, growth in

starts was strong, but in Toronto, Edmonton and Halifax starts decreased (see Figure 23). Growth in housing starts in rural areas, at 9.5 per cent, outpaced growth in urban centres (6.5 per cent) in 2004. Rural starts, however, remained less than 13 per cent of total starts.

Starts of single-detached homes were up 4.8 per cent in 2004 as they recovered from a slight decline in 2003. Multiple starts, however, grew at a much stronger pace of 9.5 per cent in 2004. Multiple starts increased in half of the provinces in 2004, the strongest growth being in Newfoundland and Labrador (up 41.8 per cent to 640 units), British Columbia (up 35.5 per cent to 18,900 units), Saskatchewan (up 30.4 per cent to 1,600 units) and Quebec (up 28.2 per cent to 29,600 units). Stronger growth in multiple starts is typical when home prices are rising rapidly and reflects the fact that many buyers are looking for less expensive alternatives to single-detached homes.

Rising land prices contribute to higher house prices

The land component of the New Housing Price Index (NHPI) for single-detached houses rose three per cent in 2004, double the increase in 2003. The full index moved

FIGURE 23

HOUSING STARTS, SELECTED URBAN CENTRES, 2003-2004

Source: CMHC (Starts and Completions Survey)

up 5.5 per cent, the largest increase since 1989. Since the NHPI is based on the prices of new houses of constant quality,⁴⁷ it is intended as a measure of the appreciation in the value of new homes. Despite the rise in home values, the shift to houses of higher quality (such as better location, larger size, better material) that started in 2003 continued.

This can be seen by comparing the increase in the NHPI for single-detached homes to the average new single-detached house price, which increased by 9.5 per cent in 2004. The average new home price is a more general measure in which the quality of homes sold can change. The increase in average price of new homes was four percentage points higher than the increase in the NHPI (9.5 per cent compared to 5.5 per cent). This is an indication of how the rising quality of homes purchased contributes to the rising level of prices for new houses.

Among large urban centres, the increase in the average new home price ranged from a low of 3.6 per cent in Windsor to 18 per cent in Victoria (see Figure 24).

Rising cost of building materials raised construction costs in 2004

Following several years of modest increases, construction costs jumped in 2004 (see Figure 25). On average, construction costs rose 6.6 per cent for single-detached housing and 6.5 per cent for apartments.

For single-detached houses, costs are measured by an index that includes the prices of 39 building materials. For apartments, the index is based on contractors' bids on an extensive range of subcontracts that reflect wage rates, prices of materials and profit margins.

Rising prices for wood products, particularly studs, plywood and particle-board, have contributed to the rising construction costs for single-detached homes. Wood prices are the most volatile component of the building materials index and price changes tend to relate to the pace of U.S. housing construction. U.S. housing starts remained at a relatively high level in 2004, keeping both demand and prices for wood products high.

FIGURE 24

GROWTH IN AVERAGE NEW HOME PRICE AND NEW HOUSE PRICE INDEX (NHPI), SELECTED URBAN CENTRES, 2004

The New House Price Index measures prices of new houses of constant quality. The average new house price measures actual sale prices of new houses. The difference between these two measures reflects changes in the size and quality of new houses currently being sold.

Source: CMHC (Market Absorption Survey) and adapted from Statistics Canada (CANSIM II)

⁴⁷ Home quality is defined in terms of location, size and set of features.

FIGURE 25
SINGLES AND APARTMENT BUILDING COST INDEX,
CANADA, 1991-2004

Source: CMHC, adapted from Statistics Canada (CANSIM II) and custom tabulation

Rising prices for steel products were the main factor driving up construction costs for apartment buildings. Growing demand for steel in the U.S. and China helped push steel prices up 47 per cent in 2004.

Shortages of skilled labour, serviced lots concern many builders

Hourly wages for construction workers were up 1.4 per cent in 2004, moderately lower than the inflation rate of 1.8 per cent.⁴⁸ However, the average weekly earnings of construction workers increased at a more robust pace of 2.4 per cent. When average weekly earnings grow more rapidly than hourly wages it suggests that construction workers are putting in longer hours.

The decline in unemployment in the construction industry over the 1990s had made shortages of labour and skilled tradespeople a critical problem for a rising share of builders. The construction unemployment rate has remained around

8.8 per cent since 2000. While the construction unemployment rate is higher than the economy-wide unemployment rate, it is low by historical standards. Statistics Canada's *Workplace and Employee Survey* confirms that construction labour is in short supply. According to that survey, the proportion of vacant positions that remain unfilled for more than four months tends to be higher in the construction industry than in almost all other industries.⁴⁹

According to the Pulse Survey, shortages of labour and serviced lots were the issues most often cited by builders as critical problems for 2004 (see Figure 26). Builders also expressed concern over rising prices for serviced lots. Despite a decline in 2004, the

percentage of builders who considered rising costs and shortages of construction labour and skilled tradespeople to be critical problems remained high.

50 Canadian Home Builders' Association Pulse Survey, Winter 2004

Homebuilder retirement plans

Just as the population at large is aging as baby boomers approach retirement, owners and managers in the housing sector are aging. According to a recent survey of the home-building industry conducted by Clayton Research Associates for CMHC, more than 40 per cent of firms expect their principal owner or senior executives to retire within the next ten years. Only about one in five (22 per cent) homebuilder companies who expect their principals to retire within ten years have succession plans in place; almost half (48 per cent) do not have a plan and have no plans to put one together in the next two to three years. However, among those companies whose executives plan to retire within five years, about half (51 per cent) do have a succession plan in place and another 30 per cent are currently working on one or planning to develop one within the next two to three years (*see Figure 27*).

According to the same study, almost 20 per cent of homebuilders stated that, with retirement, their business will shut down. However, among those planning to retire within 10 years, fewer (14 per cent) state that they will shut down. Among those with a succession plan in place, only five per cent expect to shut down but more than half (55 per cent) stated that a relative (usually a son or daughter) will take over.

Continued move to ownership raises rental vacancy rates

The economic environment continued to be conducive to homeownership, and the movement out of rental accommodation continued in 2004. As a

result, the average rental apartment vacancy rate for 28 major urban centres⁵¹ continued to rise, reaching 2.7 per cent compared to 2.2 per cent in 2003 (*see Figure 28*).

This was the third consecutive annual increase, yet in most of these markets, the vacancy rate remained below its average for the past decade. In 2004, vacancy rates ranged from a low of 0.6 per cent in Victoria to 8.8 per cent in Windsor. In Windsor, which experienced the largest increase, the vacancy rate rose by 4.5 percentage points to 8.8 per cent from 4.3 per cent in 2003. In most centres, the change in the vacancy rate was less than one percentage point.

Rents up moderately

Despite the increase in vacancy rates, the average monthly rent for a two-bedroom apartment in the 28 major urban centres was up 2.3 per cent to \$745 in 2004, stronger than the 1.1 per cent increase in 2003. Rents for other apartment types increased at slower rates. Among the larger urban centres, Québec City experienced the sharpest increase, while in Calgary and Ottawa the average rent for a two-bedroom apartment was virtually unchanged (*see Figure 29*).

Source: CMHC (Rental Market Survey)

Additional supply contributes to easing market conditions

About 18,800 new rental apartments were completed during 2004⁵² (see Figure 30), up 10.8 per cent from 2003. While apartment completions were up, growth in 2004 slowed markedly from the 36.3 per cent increase in 2003.

At the end of 2004, the number of rental apartments under construction stood at about 16,600 units, which will add further to the supply of rental dwellings in 2005. Quebec continued to lead in rental construction, accounting for more than 47 per cent of Canada's rental apartment completions in 2004.

Condominium apartment completions totalled about 38,000 units in 2004,⁵³ up 4.8 per cent from 2003. Condominiums affect the rental market

vacancy rate in two ways—they are a relatively inexpensive entry to homeownership and are often purchased by renter households, and some investors buy condominium apartments and rent them out. These for-rent condominiums compete with units in the traditional rental market.

For example, in Toronto, the number of condominiums rented out by their owners increased by an estimated eight per cent to 34,900 units in 2004. This compares to about 304,700 apartments in the traditional rental market. The vacancy rate for rented condominiums in Toronto dropped to 0.8 per cent⁵⁴ in 2004, while in the traditional market it rose to a record 4.3 per cent. Rents for one- and two-bedroom condominium units were down marginally in 2004.⁵⁵

FIGURE 29
AVERAGE RENT, TWO-BEDROOM APARTMENTS,
CANADA AND SELECTED URBAN CENTRES, 2003-2004

Average rents are for privately initiated apartment structures of three units or more. The CMA average represents the weighted average of the rates in the Census Metropolitan Areas (urban areas with core populations of 100,000 or more); i.e., Ottawa and Gatineau treated as two areas. The Canada average represents the average two-bedroom rent in urban centres with populations of 10,000 or more.

Source: CMHC (Starts and Completions Survey, Rental Market Survey)

According to the *Survey of Household Spending*,⁵⁶ about a quarter of condominiums across the country are rented.⁵⁷

Secondary rental market large and diverse

In addition to the conventional units tracked by CMHC's *Rental Market Survey* and *Starts and Completions Survey*, the rental market includes a variety

of living arrangements, at times referred to collectively as the secondary rental market. Examples include single- and semi-detached houses, condominiums, duplexes, rooms and "accessory apartments." Accessory apartments are independent living spaces within a home. Basement apartments are a common example.

There is no direct count or survey of the secondary market. However, using the total number of renter households from the 2001 Census of Canada and subtracting from it the number of rental units in CMHC's rental market universe, it is possible to estimate the size of the secondary rental market in each Census Metropolitan Area (CMA). Figure 31 presents estimates for the seven largest Canadian rental markets.

The relative size of the secondary rental market varies from a high of 65 per cent in Abbotsford, British Columbia, to a low of 19 per cent in Sherbrooke, Quebec.

The Census data also allow a further breakdown of the secondary rental market into single, semi-detached and row units; condominium apartment units;⁵⁸ and duplex units (see Figure 32).

FIGURE 31

SECONDARY RENTAL MARKET ESTIMATES, SELECTED URBAN CENTRES, 2001

	Total renter households (2001 Census)	Rental units in CMHC's 2001 RMS universe	Estimated size of secondary rental market	Share of secondary rental market within total rental market
Montréal	707,242	516,477	190,765	27%

⁵⁶ Statistics Canada, *Survey of Household Spending*, 2002

⁵⁷ This result is in line with the results of CMHC's Greater Toronto Area condominium survey and a study of the Vancouver condominium market entitled *The impact of investors on the market for apartment condominiums in selected markets in the Vancouver CMA*, 2003. Both reports found similar percentages of investor-held condominiums.

⁵⁸ Rented high-rise apartments other than those tracked by CMHC's *Rental Market Survey* (RMS) are assumed to be rented condominiums. In addition, 60 per cent of the rented low-rise apartments not tracked by the RMS are assumed to be rented condominiums.

FIGURE 32

PERCENTAGE OF RENTAL HOUSEHOLDS IN SECONDARY
RENTAL MARKET DWELLING TYPES, SELECTED URBAN CENTRES, 2001

	Single, semi-detached and rowhouses	Condominium apartments	Duplex
Montréal	8%	9%	4%
Toronto	16%	8%	3%
Vancouver	21%	13%	12%
Québec	11%	10%	8%
Ottawa	18%	4%	4%
Edmonton	21%	3%	3%
Calgary	30%	3%	8%
All CMAs	17%	7%	6%

Rented high-rise apartments other than those tracked by CMHC's Rental Market Survey (RMS) are assumed to be rented condominiums. In addition, 60 per cent of the rented low-rise apartments not tracked by the RMS are assumed to be rented condominiums.

Source: CMHC (Rental Market Survey) and adapted from Statistics Canada (Census of Canada)

Rented singles, semi-detached and row houses have the largest share of units in the secondary rental market, accounting for 17 per cent of all rental units across all CMAs. Rented condominiums are the second largest in the secondary market, followed by duplexes.

The rental market has evolved over time. The arrival of condominiums in the housing market has made real estate accessible to small investors, who can purchase a unit and offer it for rent. The larger size of homes today and smaller households also make it more feasible to develop accessory apartments. It is likely, therefore, that these factors have increased the size of the secondary market over time.

Accessory apartments are often a source of affordable housing. According to a survey in the City of Toronto, tenants with incomes of less than \$40,000 tended to rent accessory apartments more frequently than those in higher income groups.

Gap between cost of owning and renting widens

A simple comparison of trends in the rental and existing home markets found that the gap between the cost of renting and owning widened significantly in 2004. On average, rents were up about 1.9 per cent, while mortgage carrying costs⁵⁹ of a newly purchased existing home were up 8.1 per cent. This increase in mortgage

carrying costs mostly reflects rising home prices.

According to the shelter component of the Consumer Price Index, shelter costs increased by 2.5 per cent in 2004. The shelter component of the CPI can be broken down into owned accommodation costs, rented accommodation costs and utility costs. The costs associated with utilities increased by 3.3 per cent in 2004; accommodation costs associated with homeownership rose 2.8 per cent while those associated with renting were up only 1.1 per cent (see Figure 33).

Growth in renovation spending strengthened in 2004

Total renovations are a combination of alterations and improvements that raise the value of a home and repairs that maintain value. Spending on alterations and improvements reached about \$28 billion in 2004, up 13.6 per cent. Alterations and improvements accounted for nearly three-quarters of total renovation spending, which was up 12.5 per cent.

FIGURE 33

SHELTER COSTS, CANADA 2004

	Per cent change	Share
Owned accommodation	2.8	59.7
Insurance	10.9	4.4
Maintenance	2.0	6.8
Interest	0.1	20.0
Replacement	6.4	12.3
Property taxes	3.2	11.8
Other	5.3	4.4
Rented accommodation	1.1	23.0
Rent	1.0	22.3
Insurance	2.2	0.4
Maintenance	1.1	0.3
Utilities	3.3	17.3
Electricity	4.1	9.7
Water	4.2	1.9
Piped gas	-2.1	3.9
Fuel oil	10.0	1.8

Share indicates the relative importance of the item in overall shelter costs.

59 Based on the average MLS® price, average five-year mortgage rate and a 25-year amortization and 10 per cent down payment.

Strong job growth in recent years has generated steady income gains, which help finance renovation projects. The strong labour market has also given households the confidence to go ahead with renovations. As well, low mortgage rates over the past few years have made mortgage refinancing an attractive way to pay for renovations. Over half the proceeds from refinancing in 2004 were used for renovation-related activity,⁶⁰ making mortgage refinancing an important source of renovation financing.

Most homeowners renovate within three years of buying their homes, making sales of existing homes the principal driving force in renovation spending. Consequently, the record-breaking levels of sales of existing homes over the past several years have provided a solid foundation for renovation spending (see Figure 34).

More Canadians expect to renovate

CMHC's *Consumer Intentions to Buy or Renovate a Home* survey, conducted in late 2004, asked householders in six major markets about their plans to renovate over the next 12 months.

FIGURE 34
RENOVATIONS AND MLS® SALES, CANADA, 1991-2004

Source: CMHC, adapted from Canadian Real Estate Association (MLS®) and Statistics Canada (CANSIM II)

Households saying they have a high probability of renovating in the next 12 months are called “ready to renovate.” Those “thinking about renovating” in the next 12 months have about a 50-50 chance of renovating in the next 12 months, while “possible renovators” have a lower likelihood of renovating.

The survey classes renovations as one of three major types.

- *Repairs and maintenance* includes projects such as painting and wallpapering, the replacement of insulation and repairs to driveways that keep the structure and equipment in “as new” appearance.
- *Replacement of existing or installation of new equipment* includes projects such as replacing or installing new heating or air conditioning equipment, plumbing fixtures or built-in appliances.
- *Remodelling and alteration* projects include remodelling rooms, adding or replacing doors and windows, adding eavestroughs, upgrading insulation, or renovating exterior walls.

Replacement of existing or installation of new equipment was the most popular type of planned renovation, accounting for more than half of all projects.

FIGURE 35

PLANNED EXPENDITURE. AVERAGE FOR CANADA, 2004

"Average" means the weighted average, calculated from results for Vancouver, Calgary, Toronto, Ottawa, Montréal and Halifax.

Source: CMHC (Consumer Intentions to Buy or Renovate a Home)

Across the six markets, 39 per cent of homeowners were planning to renovate between the end of 2004 and the end of 2005 (see Figure 35). Over one-quarter (28 per cent) expressed strong intentions and were "ready to renovate," while nine per cent were "thinking about renovating" and two per cent were "possible renovators." Intentions to renovate are up compared to 2002, the year of the previous survey. At that time, 34 per cent of homeowners expressed an intention to renovate and only 23 per cent said they were "ready to renovate." Renovation intentions in 2004 were the strongest in Halifax (45 per cent) and Ottawa (44 per cent).

Close to half of the homeowners planning renovations (47 per cent) expected to spend more than \$5,000 on their projects (see Figure 36), including 24 per cent who planned to spend more than \$10,000. Toronto, at 31 per cent, and Calgary, at 30 per cent, had the highest

proportion of homeowners who planned to spend more than \$10,000 on their renovations.

Nearly an equal share of homeowners planning repairs and maintenance expected to hire a skilled tradesperson or renovation contractor to do all the work (45 per cent), while 41 per cent expected to do all the work themselves. At the time of the survey, one in three of the homeowners planning to hire a professional had already contacted a contractor for information. In 2004, about 30 per cent of renovation projects involved exterior work (see Figure 37). These projects include landscaping, exterior painting, construction of decks, patios, garages and fences and repairs to roofs and foundations. Other popular renovations include remodelling bathrooms and replacing carpets and flooring.

Strong housing market leads mortgage credit and approvals growth

The robust housing markets of 2004, described in “Current Market Developments,” were reflected in the strong growth of mortgage approvals and mortgage credit.

The total value of mortgage approvals in 2004 increased to \$161 billion, up 17.1 per cent from 2003. The growth reflects a 9.8 per cent increase in loan approvals as well as a 6.7 per cent increase in the average loan amount in 2004 compared to 2003 (see Figure 38).

Outstanding mortgage credit grew to \$568 billion by the end of 2004, up 9.6 per cent from 2003 (see Figure 39).

Mortgage payment-to-income ratio near all-time low

Canadian household debt has risen steadily over the past 30 years and its ratio relative to annual income has increased to over 100 per cent.

Looking at debt as a ratio to income, however, does not capture the impact of low interest rates on reducing the financing costs of debt. The mortgage payment-to-income ratio has been near an all-time low for several years.

FIGURE 38
RESIDENTIAL MORTGAGE APPROVALS, CANADA, 1990-2004

Mortgage approval data are gross and may not fully capture lending activities of credit unions, caisses populaires and privately-insured loans in some areas

Source: CMHC (NHA loan approval system and Conventional Lending Survey)

Furthermore, much of the increase has been used to acquire assets. As a result, the net worth of persons and unincorporated businesses has increased steadily over the past 30 years, with an average growth rate of eight per cent per year. In 2004, mortgage debt accounted for 68.7 per cent of total household debt, down from the peak of 74.5 per cent in 1993 (see Figure 40). Given the large share of mortgage debt in total household debt, rising house prices for new buyers have contributed to the increased indebtedness of households.

FIGURE 39

Mortgage rates make the difference

Despite recent increases in house prices, mortgage payments as a share of household income are currently very low by historical standards. This is shown by calculating the mortgage payment for a house purchased at the average MLS® price and financed at the posted five-year mortgage rate⁶¹ and dividing it by the average household after-tax income to obtain the debt-service cost-to-income ratio.

In 2004, the average monthly mortgage payment was \$1,337—two per cent lower than in 1989, the previous peak in inflation-adjusted existing home prices. However, from 1989 to 2004, household after-tax income increased by 55 per cent. As a result, the annual mortgage payment-to-income ratio dropped to 31 per cent in 2004 from over 49 per cent in 1989 (see Figure 41).

At current house prices and after-tax income levels, the five-year mortgage rate would have to climb to nearly 13 per cent, more than double the rate of 6.1 per cent

at the end of 2004, to push the mortgage payment-to-income ratio back up to the 1989 level.

As a result, low mortgage rates have offset much of the impact of rising house prices on mortgage debt service costs. The cost of a mortgage as a percentage of after-tax income has been relatively stable in recent years and well below the level of the early 1990s. In other words, Canadians' ability to pay has kept up with the increase in house prices.

Variable rate mortgages increase in popularity

Forty-five per cent of respondents in the September 2004 FIRM⁶² survey stated that their current mortgage rate was less than five per cent, up significantly from about 30 per cent who reported the same a year earlier. Indeed, 63 per cent of respondents who took out or renewed their mortgage within the six months immediately prior to the survey date obtained a mortgage rate below

FIGURE 40
RESIDENTIAL MORTGAGES ACCOUNT FOR LESS THAN 69 PER CENT OF HOUSEHOLD DEBT

61 The mortgage payment calculation assumes that the buyer made a 10 per cent down payment.

62 The *Financial Industry Research Monitor* (FIRM) is a quarterly survey of consumer attitudes and intentions by Clayton Research and Ipsos-NPD.

five per cent. At the date of the survey, most mortgage customers had a five-year term, while only 14 per cent had a term over five years. Variable-rate mortgages continue to increase in popularity, with 29 per cent of mortgage customers choosing them, up significantly from just 11 per cent three years earlier.

CMHC's Mortgage Consumer Survey and focus group findings

The 2004 CMHC *Mortgage Consumer Survey* is a unique perspective into the attitudes and behaviours of Canadian mortgage consumers. The survey examined a variety of topics such as how mortgage consumers gather information and how they behave when acquiring or renewing a mortgage.

According to the survey:

- Most mortgage consumers relied on personal information sources such as their present lender, family and friends, real estate agents, and mortgage brokers when looking for mortgage information. Just under half of purchasers used the Internet for finding information, while 35 per cent of refinancers and 31 per cent of renewers used the Internet.
- Nearly two-thirds of purchasers checked competitive lending rates; 42 per cent checked services offered by different lenders and 40 per cent said they shopped around to get several proposals. Two-thirds of purchasers also obtained a pre-approved mortgage.
- About half of mortgage consumers obtained other financial products and services such as lines of credit or disability, life or property insurance when obtaining their mortgage.
- Consumers reported that the mortgage rate was their main consideration in selecting a mortgage lender. Flexibility in mortgage terms, such as a pre-payment option, was also a key consideration.
- In 2004, only 14 per cent of homeowners switched lenders when renewing their mortgage, even though 35 per cent had expressed an intention to do so. First-

Source: CREA, Statistics Canada, CMHC.

time buyers showed less loyalty when looking for a mortgage—46 per cent obtained their mortgage from a lending institution other than the one they dealt with before buying a home.

- About one in four consumers (26 per cent) buying a home used a mortgage broker. First-time buyers showed a greater tendency to use brokers, with almost one in three (32 per cent) relying on a broker. Homeowners renewing or refinancing a mortgage were less likely to use a mortgage broker. Within these segments, brokers handled 15 per cent of homes that were refinanced and six per cent of mortgage renewals.
- In 2004, 56 per cent of mortgage consumers had positive attitudes about Canada's mortgage industry, saying that the industry functions efficiently and effectively. Another 27 per cent were neutral and 16 per cent were somewhat negative. Over two-thirds agreed that mortgage professionals acted responsibly and ethically, while just one in ten disagreed.

To gain further insights into consumer behaviour, qualitative research findings from focus group discussions with mortgage consumers supplemented the 2004 CMHC *Mortgage Consumer Survey*.

Focus group highlights show:

- Some consumers, particularly first-time buyers, perceive getting a mortgage as a complex process involving anxiety and stress. Focus group participants repeatedly said that they had difficulty understanding the technical information and jargon used by mortgage professionals and were often left bewildered.
- The Internet and newspapers were seen as convenient ways to find facts about mortgages. Consumers used both sources to research and compare information about rates and features. Friends and acquaintances with previous mortgage experience played an important role in providing guidance and helping to compensate for perceived lack of knowledge about mortgages.
- The 2004 CMHC *Mortgage Consumer Survey* clearly showed that mortgage rates were the most important factor in selecting a lender. For some focus group participants a competitive “financial package,” which included the total cost and benefits of the mortgage, drove the purchase decision. These people tended to make a more rational business decision and were willing to trade off convenience and relationships with their current lender to lower their mortgage costs.
- Flexibility and terms ranked second in importance only to rates in selecting a lender. Focus group participants said that they saw flexibility as a way to lessen the anxiety of making a stressful mortgage decision. The less participants felt bound by their decision and the more flexibility they had with their mortgage, the more comfortable they tended to be with their choices.

Mortgage rates continued to trend downwards

Posted mortgage rates have been roughly 240 basis points higher than bond yields in recent years (100 basis points equals one percentage point) (see Figure 42). As a result, lenders have continued to offer discounts ranging from 50 to 150 basis points below their posted mortgage rates. Mortgage rates in 2004 remained near historic lows, making homeownership financing very affordable.

FIGURE 42
POSTED FIVE-YEAR MORTGAGE RATES MINUS
5-YEAR GOVERNMENT OF CANADA BOND YIELDS, 2000-2004

Data represented include information up to December 31, 2004.

Source: Statistics Canada, Bank of Canada, CMHC

The five-year posted mortgage rate (see Figure 43) averaged 6.23 per cent in 2004, down slightly from 6.39 per cent in 2003.

Short-term mortgage rates move in tandem with the prime lending rate while mid- and long-term mortgage rates vary in response to the cost of raising funds in the bond markets.

Much of the monetary tightening in 2004 did not come in the form of increases in the Bank of Canada's overnight lending rate. Indeed, the increases of 25 basis points in September and October merely reversed two of the three 25-basis-point decreases in the first half of the year.

The removal of monetary stimulus was instead achieved through the strong appreciation of the Canadian dollar. On an annual average basis, the Canadian dollar appreciated by eight per cent in 2004 after rising by 12 per cent in 2003. The rapid rise in the dollar resulted in a tightening of monetary conditions, which allowed short-term interest rates to remain low.

Mortgage-backed securities on the rise

The *National Housing Act* Mortgage-Backed Securities Program (NHA MBS) helps give investors the opportunity to make a secure investment in insured Canadian residential mortgages. Under this program, CMHC guarantees timely payment of principal and interest to the investor.

FIGURE 43

POSTED FIVE-YEAR MORTGAGE RATE, CANADA, 2000-2004

Data represented include information up to December 31, 2004.

Source: Statistics Canada, Bank of Canada, CMHC

Mortgage-backed securities (MBS) are an indirect way to fund mortgages and represent an investment in an undivided interest in a pool of residential mortgages. In this way, mortgage securitization provides a competitive, secondary-mortgage market system for housing finance. The net result is that securitization places downward pressure on mortgage rates by converting the supply of private investor funds to mortgages.

The principal and interest paid by borrowers on the mortgages in an NHA MBS pool is paid to investors on a monthly basis. These payments can vary from month to month if, for example, borrowers make unscheduled payments, such as advance payments of principal on a mortgage. Because of this prepayment risk, many investors prefer a bond-type of product.

For this reason, CMHC introduced Canada Mortgage Bonds (CMB) in June 2001. CMB are semi-annual coupon, fixed-or floating-rate bonds and pay principal at maturity. Like NHA MBS, CMB carry the full guarantee of the Government of Canada.

NHA MBS issuance totalled \$30 billion in 2004, an increase of 9.5 per cent from 2003. Of this total, \$19.3 billion was issued for the CMB program, while the remainder was issued directly to investors in the secondary market. At the end of December, total issuance of mortgage-backed securities (MBS) stood at more than \$37.7 billion, about 15 per cent higher than in 2003. The outstanding amount of CMB guaranteed by CMHC rose to \$54.5 billion in 2004.

Medium-term issues remain most common

Over 85 per cent of the dollar amount of MBS issuances in the first nine months of 2004 were for four- to five-year terms. Longer-term issues accounted for one per cent, while shorter terms accounted for about 14 per cent. The five-year term structure remains most popular for issuers, simply because it closely matches borrower preference for five-year mortgages.

In 2004, chartered banks accounted for 87.4 per cent of the dollar amount of new NHA MBS issues, followed by trust companies at seven per cent.

Total MBS outstanding reached \$78.6 billion by the end of December 2004. NHA MBS accounted for 12.1 per cent of the total residential credit outstanding in Canada in 2004, up from 9.6 per cent in 2003.

Variable-rate and adjustable-rate MBS

Variable-rate mortgages and, to a lesser extent, adjustable-rate mortgages have gained considerable popularity with homebuyers in the last few years.

A key reason is the trend to lower mortgage rates over the last four years and, in particular, prime lending rates that have been at, or near, historic lows. Very low short-term rates, combined with attractive discounts, have been a major draw for mortgage consumers.

A variable-rate mortgage payment generally remains constant over the term, while the interest rate varies based on the prime rate or a related money-market rate. An adjustable-rate mortgage payment fluctuates with interest rate movements.

In response to the growing interest in these types of mortgages, CMHC has introduced new MBS products to facilitate their pooling: the 985 mortgage pool for variable-rate mortgages and the 980 pool (introduced in June, 2005) for adjustable-rate mortgages. The growth in variable-rate and adjustable-rate mortgages has been managed for the most part on lender balance sheets. However, these new pool types will facilitate the securitization of these mortgages into highly rated NHA MBS, offering lenders a new source of liquidity and low cost funding through the secondary market.

Why there is no housing bubble in Canada

A bubble occurs when an asset experiences price increases well in excess of historical norms for a sustained period of time, based mainly on the speculation that the asset can be sold in the future at a higher price to someone who will buy it for the same reason. Although house prices have risen in recent years, Canadian housing markets are grounded in solid economic fundamentals.

In 2003, the inflation-adjusted average MLS® price surpassed its previous peak

House prices have climbed significantly in recent years and the average real (inflation-adjusted) MLS® selling price for Canada has surpassed the previous peak established 14 years earlier. However, surpassing the previous peak in real house prices does not mean that there is a house price bubble. There are several reasons for this.

First, outside of Toronto and a few other select centres in southern Ontario, there was no evidence of a price bubble in housing markets in the late 1980s. Therefore, the previous peak in real prices for Canada is not a threshold beyond which we have a house price bubble.

Second, the bubble in Toronto inflated over a four-year period from 1986 to 1990, when house prices rose rapidly in spite of deteriorating demand from homebuyers and a rising supply of homes for sale. Today, the rise in home prices reflects solid market fundamentals across the country.

Third, part of the recent increase in house prices is due to an increase in the quality of houses sold, as well as a higher degree of synchronization in housing markets than in the past. In the late 1980s, relatively low real house prices in some provinces dampened the rise in the Canada-wide average house price. Today, the synchronized rise in prices

means that all regions of the country are contributing to the rise in the average house price for Canada.

Mortgage rates make the difference

Despite recent increases in house prices, the mortgage payment burden on household budgets is currently very low. To measure this burden, the mortgage payment on the average-priced house, financed at the posted five-year mortgage rate, is divided by the level of average household after-tax income.

In 2004, the average monthly mortgage payment was \$1,337—two per cent lower than in 1989, the previous peak in inflation-adjusted existing home prices. However, from 1989 to 2004, household after-tax income increased by 55 per cent. As a result, the annual mortgage payment-to-income ratio dropped to 31 per cent in 2004 from over 49 per cent in 1989.

At current house prices and after-tax income levels, the five-year mortgage rate would have to climb to nearly 13 per cent, more than double the 2004 five-year mortgage rate, to push the mortgage payment-to-income ratio back up to the 1989 level. Thus, historically low mortgage rates have offset much of the impact of rising house prices. As a result, the annual mortgage cost as a percentage of after-tax income has been relatively stable in recent years and well below its level in the early 1990s.

No housing bubble for Canada

Canada's housing markets have been vibrant and their expansion created upward pressure on prices. However, rising prices are being supported by solid fundamentals. Canadians' ability to pay has kept up with the rise in house prices and, given the low inflation environment, the financial risk from future mortgage rate increases is very low.

ABORIGINAL HOUSING

Introduction

Aboriginal households face tremendous challenges in accessing adequate housing. The challenges include low incomes, unemployment, regional characteristics such as remoteness and harsh climate conditions that contribute to high costs of construction in the North, and legal barriers to homeownership on reserves.

A limited supply of affordable housing results in unhealthy, overcrowded conditions and accelerates depreciation of the housing stock—a process made worse by the severe northern climate.

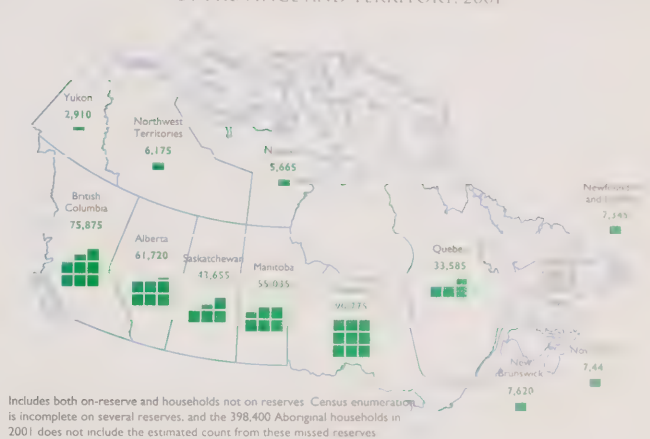

As a result, housing conditions for many Aboriginal households do not compare to those of the Canadian population in general.

This feature is an in-depth look at Aboriginal households and housing conditions. It examines some of the challenges to improving those conditions; looks at recent government–Aboriginal consultations on the problems; and, describes some Aboriginal initiatives to address the challenges.

Aboriginal population close to one million

The Aboriginal population in Canada is growing at a faster rate and is younger than the overall population. In 2001, the Aboriginal population had reached nearly one

FIGURE 44
DISTRIBUTION OF ABORIGINAL HOUSEHOLDS
BY PROVINCE AND TERRITORY, 2001

Source: CMHC, adapted from Statistics Canada (Census of Canada)

million and had grown by 22 per cent since 1996.⁶³ In the same five years, Canada's population as a whole grew by just four per cent, and the non-Aboriginal population grew by a mere 3.4 per cent.

Statisticians and demographers believe about half the increase is the result of increased awareness of Aboriginal roots and more complete enumeration of on-reserve populations. The other half is due to demographic factors, specifically the high birthrate of the Aboriginal population, which is 1.5 times higher than the general Canadian average.

63 Demographic factors are thought to have accounted for about half this growth, increased awareness of Aboriginal roots and more complete enumeration of reserves for the other half. Statistics Canada, 2001 Census: analysis series *Aboriginal peoples of Canada: A demographic profile*, Statistics Canada Catalogue no. 96F0030XIE2001007 (Ottawa: Statistics Canada, 2003), p. 6.

FIGURE 45
BREAKDOWN OF ABORIGINAL HOUSEHOLDS
BY ABORIGINAL IDENTITY, 2001

Note: Percentages do not total 100 per cent since households that reported more than one Aboriginal identity were counted for each identity group.

Source: CMHC, adapted from Statistics Canada (CANSIM II)

The Aboriginal population is also much younger than the non-Aboriginal population, with a median age of 24.7 years, compared to 37.7 years for non-Aboriginals. The increasing size and young average age of the Aboriginal population contribute to the increase in new households, which creates the need for more housing.

Aboriginal households total 3.4 per cent of all households

In 2001, Aboriginal households made up 3.4 per cent of all households in Canada (see Figure 44 for geographic household distribution). Of the 398,400⁶⁴ Aboriginal households counted in the 2001 Census of Canada, 73,315—nearly 20 per cent—were living on-reserve.

Aboriginal households in Canada are made up of three groups: North American Indians (Status and Non-status Indians), Métis and Inuit. North American Indians, also referred to as First Nations peoples, were the largest group, accounting for 70 per cent of all house-

holds (54 per cent Status Indian and 16 per cent Non-status Indian—see Figure 45). Métis households accounted for 35 per cent of the total and Inuit for four per cent. (The percentages do not total 100 since households that reported more than one Aboriginal identity were counted for each identity group.)

Ontario (90,780), British Columbia (75,880), and Alberta (61,715) had the largest number of Aboriginal households. The highest proportions of Aboriginal households outside the territories were in the Prairie provinces of Manitoba (12.7 per cent) and Saskatchewan (11.5 per cent). Within the Territories, the highest proportion was in Nunavut (79 per cent), followed by the Northwest Territories (49.1 per cent) (see Figure 46).

The cities of Winnipeg (24,955), Vancouver (18,300) and Edmonton (17,830) had the highest number of off-reserve First Nations households and Métis and Inuit households.

While most Aboriginal households not living on reserves (61 per cent) lived in urban areas, this was far below the comparable figure for non-Aboriginal households (84 per cent). Around 19 per cent of Aboriginal households lived in rural areas and just one per cent on farms.

FIGURE 46
ABORIGINAL HOUSEHOLDS AS A PERCENTAGE OF
ALL HOUSEHOLDS, 2001

Source: CMHC, adapted from Statistics Canada (Census of Canada)

⁶⁴ In 2001, Census enumeration was incomplete on 30 reserves with an estimated population of 31,000. The 398,400 Aboriginal households does not include the estimated count from these incompletely enumerated reserves.

Housing conditions outside reserves

In 2001, nearly 24 per cent of off-reserve First Nations households and Métis and Inuit households were in core housing need, compared to 13.5 per cent of non-Aboriginal households.

While this percentage of households in core housing need remains unacceptably high, and well above that of non-Aboriginal households, it is declining and the gap is narrowing.

Between 1996 and 2001, the decline in the percentage of Aboriginal households in core need (from 30.3 per cent to 23.8 per cent) exceeded the drop for non-Aboriginal households (15.3 per cent to 13.5 per cent) (see Figure 47). This decline occurred in all types of Aboriginal households, but was least evident in Inuit households where the decline was marginal (to 31.8 per cent from 32.8 per cent).

On average, annual Aboriginal household incomes lag significantly behind those of non-Aboriginal households, making affordability a primary housing problem for many. In 2001, 19 per cent of Aboriginal households not living on reserves had affordability problems and were in core housing need, compared to just 12 per cent of non-Aboriginal households.

FIGURE 47
INCIDENCE OF CORE HOUSING NEED OUTSIDE RESERVES
1996-2001

Aboriginal total does not include on-reserve households

Source: CMHC (census-based housing indicators and data, revised 2005)

Aboriginal households are also much more likely to live in housing that falls below adequacy and suitability standards than non-Aboriginal households. In 2001, six per cent of Aboriginal households lived in inadequate homes (dwellings that required major repairs and were in core housing need), compared to just two per cent of non-Aboriginal households. Similarly, in terms of

Definition of Aboriginal population and Aboriginal households

There are various definitions of the Aboriginal population. This feature uses the "identity concept." It is based on a direct Census question that asks respondents if they are Aboriginal. The person is also considered Aboriginal if they answer "yes" to either one of two other Census questions, namely:

- "is the person a member of an Indian Band/First Nation", or
- "is the person a Treaty Indian or a Registered Indian as defined by the *Indian Act* of Canada".

For the purpose of analyzing Aboriginal housing conditions, CMHC defines an Aboriginal household as a household in which at least one spouse, common-law partner or a lone parent self-identifies as Indian (Status or Non-status), Métis, Inuit; or, at

least 50 per cent of household members self-identify as belonging to one of these Aboriginal groups.

Core housing need

A household is in core housing need if it falls below one or more of the adequacy, suitability or affordability standards and cannot find local rental housing to meet all three standards. For a detailed definition of these terms, see the chapter entitled "Housing Affordability."

On-reserve, most households pay their housing costs through Band housing arrangements and shelter costs are not available. Thus, the total number of households with an affordability problem cannot be determined. However, other standards can be examined.

Core housing need estimates revised

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace the core housing need statistics in previous editions.

During verification of ongoing research, CMHC found that some households had been misclassified when Statistics Canada applied core housing need to both the 1996 and 2001 Censuses.

The misclassification overestimated core housing need for both the 1996 and 2001 Censuses.

The misclassification does not affect 1991 Census data.

There is more information about the effect of the misclassification at www.cmhc-schl.gc.ca/en/about/whwedo/whwedo_021.cfm

suitability, close to six per cent of Aboriginal households lived in crowded conditions and were in core housing need, compared to just under two per cent of non-Aboriginal households (see Figure 48).

Housing conditions also vary among households of different Aboriginal identity.⁶⁵ In Inuit households, which account for about four per cent of all Aboriginal households, the most prevalent problem was suitability (crowding). For all other groups, affordability was the principal problem, with the highest incidence being among Status Indians.

A large number of Aboriginal families are raising their children in strained circumstances. Over one-third of Aboriginal households in core housing need are lone-parent households, almost twice the proportion of non-Aboriginal households. Compared to the non-Aboriginal

FIGURE 48
SHARE OF ABORIGINAL HOUSEHOLDS (NOT LIVING ON RESERVES) IN CORE HOUSING NEED AND BELOW HOUSING STANDARDS, 2001

Aboriginal total does not include on-reserve households.

Source: CMHC, (Census-based housing indicators and data, revised 2005)

population, lone-parent households are more prevalent among the Aboriginal population, and a higher percentage of these households find themselves in core housing need. In fact, almost half of Aboriginal lone-parent households are in core housing need (see Figure 49).

FIGURE 49
INCIDENCE OF CORE HOUSING NEED BY HOUSEHOLD TYPE FOR THOSE NOT LIVING ON RESERVE, 2001

Aboriginal total does not include on-reserve households.

Source: CMHC, (Census-based housing indicators and data, revised 2005)

65 For Aboriginal family households, any household in which at least one spouse, common-law partner, or a lone parent identifies as Indian (Status or Non-status), Métis or Inuit is counted accordingly. For Aboriginal non-family households, any household in which at least half the members identify as Indian (Status or Non-Status), Métis, or Inuit is counted accordingly. This approach enables the range of Aboriginal identities to be examined, but it also means that the sum of identity subtotals will add up to more than the total of Aboriginal households. For example, a household with one Métis and one Inuit spouse will be counted as both a Métis household and an Inuit household.

FIGURE 50

CORE HOUSING NEED MORE PREVALENT AMONG RENTERS,
CANADA, 2001

Aboriginal total does not include on-reserve households.

Source: CMHC (Census-based housing indicators and data, revised 2005)

By contrast, within the non-Aboriginal population, most people who are in core need are not raising children. Non-family households account for only 28 per cent of Aboriginal households in core need while the comparable figure among non-Aboriginal households is 50 per cent.

Rental households were more likely to be in core housing need than homeowners. The percentage of Aboriginal homeowners in core housing need was 9 per cent for Métis households, 11 per cent for Status and Non-status Indian households, and 20 per cent for Inuit households. Levels of core housing need among renters ranged from 33 per cent for Métis households to 37 per cent for Non-status Indian households, 38 per cent for Inuit households, and 41 per cent for Status Indian households (see Figure 50).

Homeownership rates rise

Homeownership rates differ markedly across the different Aboriginal groups. Métis households had the highest ownership rates, while Inuit households had the lowest (see Figure 51). As discussed later in this Feature, subsidized rental housing accounts for a high proportion of the housing stock in the North.

Homeownership rates increased for all Aboriginal groups between 1996 and 2001 and the gap between non-Aboriginal and Aboriginal

Cautions in interpreting changes in areas outside reserves

It should be noted that, in recent years, a growing number of people who had not previously identified with an Aboriginal group now do. Between 1996 and 2001 the largest growth was among those identifying as Métis. For example, three provinces reported Métis household growth rates exceeding 100 per cent. It is difficult to determine the extent to which changes in statistics on housing conditions, (for example, the reduction in the percentage in core need and the increasing homeownership rate), may be affected by this. Some of the improvement could be because those newly identifying themselves as Aboriginal people have better housing conditions than other Aboriginals.

rates narrowed significantly. The homeownership rate for Aboriginal households outside reserves for 2001 climbed to almost 50 per cent from 43 per cent in 1996. The difference between Aboriginal and non-Aboriginal rates declined to 16 per cent from 22 per cent over the same five years.

FIGURE 52

ABORIGINAL PEOPLE AND HOMELESSNESS

Sources: Hamilton's Report Card on Homelessness, April 2002, p. 10.

Edmonton Joint Planning Committee on Housing, (October 2002), A Count of Homeless Persons in Edmonton and 2001 Census data for city population.

Calgary and Vancouver statistics: Canada West Foundation, "Urban Aboriginal People in Western Canada: Realities and Policies," 2001.

High rate of homelessness

Aboriginal people are over-represented in the homeless population in every major city where statistics are available. In 2002 in Hamilton, Aboriginal people represented two per cent of the city's population yet made up 20 per cent of the homeless population⁶⁶ (see Figure 52). In Edmonton in 2001, Aboriginal people made up 43 per cent of the homeless population (based on a city count in 2002) while accounting for only about six per cent of the overall population (2001 Census).

In September 2001, 13 per cent of people using homeless shelters in Vancouver were Aboriginal even though Aboriginal people made up only two per cent of the city's population. In Calgary, 18 per cent of shelter users were Aboriginal whereas they made up only two per cent of the city's population.⁶⁷

On-reserve housing conditions

Limited employment opportunities mean that social assistance is the principal source of income for a significant proportion of on-reserve households. As of 2001, the average annual income of households living on-reserve, at a little over \$32,000, was well below that of Aboriginal households not living on-reserve (see Figure 53). The lowest average incomes were in on-reserve communities in New Brunswick, Nova Scotia and Saskatchewan, and the highest were in Newfoundland and Labrador and Quebec.

Low incomes make it difficult for on-reserve households to maintain and improve their existing housing or contribute towards acquisition of new housing.

Between 1996 and March 2004, the total number of houses on-reserve increased to 95,500 from 78,200 and the number of adequate houses to 50,600 from 39,000.⁶⁸

FIGURE 53

AVERAGE INCOME FOR ABORIGINAL HOUSEHOLDS, NOT LIVING ON RESERVE AND ON-RESERVE, 2001

Source: CMHC (Census-based housing indicators and data)

⁶⁶ Hamilton's Report Card on Homelessness, April 2002.

⁶⁷ The Canada West Foundation *Urban Aboriginal People in Western Canada: Realities and Policies*, 2001.

⁶⁸ These statistics are from Indian and Northern Affairs Canada (INAC) administrative data, which includes reserves missed in the 2001 Census.

FIGURE 54

ON-RESERVE AVERAGE HOUSEHOLD SIZE, 2000-2003

subsidies for a portfolio of about 25,000 units of assisted housing, capacity development (that is, the skills and knowledge to design, build, inspect, maintain and manage housing) and other housing-related activities, such as maintenance, insurance and administration.

In 2005, the Government of Canada announced an additional investment of \$295 million for the construction of 6,400 housing units and renovation of 1,500 units over five years.

The housing shortage has resulted in severe overcrowding on-reserve, which accelerates the deterioration of housing and related infrastructure, and affects the health and social well-being of occupants. There is now an average of more than four people per household on-reserve, well in excess of the average of 2.6 people for Canada as a whole (see Figure 54).

While shelter costs are generally not available on-reserve, alternative standards can be examined. As of the 2001 Census, 22.4 per cent of the on-reserve Aboriginal households that were enumerated were living in inadequate housing and unable to afford housing in adequate conditions (see Figure 55). This is over 11 times higher than for non-Aboriginal households.

The incidence of on-reserve Aboriginal households living in crowded living conditions was also more than five times the level for non-Aboriginal households in Canada, with 10.3 per cent of on-reserve Aboriginal households living in crowded conditions and unable to afford suitably-sized housing, compared to 1.9 per cent of non-Aboriginal households.

FIGURE 55
PERCENTAGE OF ON-RESERVE ABORIGINAL HOUSEHOLDS BELOW ADEQUACY
AND SUITABILITY STANDARDS AND UNABLE TO AFFORD ACCEPTABLE HOUSING

On-reserve Aboriginal households	Total % below suitability standard	Total % below adequacy standard	Total % below suitability and/or adequacy standard
All on-reserve	10.3	22.4	27.7
Owned on-reserve	6.0	19.5	22.5
Rented on-reserve	8.9	14.8	20.4
Band housing	12.8	25.5	31.8

Note: Percentages in the first two data columns do not add to the total in the third data column since some households have both adequacy and suitability problems.

Source: CMHC (Census-based housing indicators and data)

For both crowding and adequacy, the worst housing conditions are in Band housing, where 31.8 per cent of households are either crowded, in inadequate housing, or both, and are unable to afford acceptable housing.

Northern housing conditions

Due to high unemployment rates and high construction and operating costs, a large portion of the northern population relies on assisted housing.

Canada's Inuit population lives primarily in four Inuit regions, including Nunavut, Nunavik in northern Quebec, Nunatsiavut in Labrador and Inuvialuit in the Northwest Territories.

In 2001, 16.8 per cent of Inuit households were in core housing need and overcrowded, compared to 5.7 per cent of all Aboriginal households and 1.9 per cent of non-Aboriginal households. Between 1996 and 2001, while there was a greater decline in the incidence of core housing need for all Aboriginal households than for non-Aboriginal households, Inuit households showed little improvement, with the incidence of core need declining only marginally, to 31.8 per cent from 32.8 per cent.

The Inuit population's young average age and high birthrate contribute to high growth rates for new families and households, which places additional pressure on existing housing supplies.

Challenges and issues

Efforts of Aboriginal people and governments to improve Aboriginal housing conditions are complicated by many special circumstances, including economic, social, cultural, legal, political and geographical factors. While some of these factors are common to all groups of Aboriginal people, others are specific to on-reserve households, households living outside reserves, or to northern households. The following sections discuss some of the main challenges.

Aboriginal housing challenges outside reserves

The socio-economic conditions of the Aboriginal population fall well below the overall population average in areas such as education levels, employment rates, income levels and health status.

The limited supply of affordable housing means that many Aboriginal people with low incomes live in temporary housing with family or friends, which often

results in frequent moves from one housing situation to another. Such a transient lifestyle often places Aboriginal people at higher risk of homelessness.

The high residential mobility rate of the Aboriginal population presents additional challenges to obtaining and maintaining continuous education, employment and health services.

The high incidence of homelessness among Aboriginal people requires effective mechanisms for prevention and support. These efforts must take into account conditions, services and support on-reserve.

On-reserve challenges

The remote location of many First Nations communities contributes to higher costs for construction materials, labour and utilities and can limit access to specialized expertise.

Obtaining financing for housing construction and acquisition can also be difficult because of the land-holding regime of the *Indian Act*, under which the Crown holds legal title.

There is reduced incentive for occupants to maintain and renovate their homes because on-reserve housing ownership status is unclear.

Skills and capacity development are needed to ensure effective governance of housing so that First Nations can implement and manage housing programs and housing and take more control over their housing.

Socio-economic conditions on-reserve are a barrier to improving housing and housing conditions. These conditions include low income and unemployment, low education levels, poor health and related social problems.

Northern challenges

Inuit in northern and remote areas rely heavily on social housing units because of socio-economic factors such as low employment and income. The low number of housing units and inadequate number of new units added each year to the existing housing stock has resulted in significant overcrowding.

The remote location of Inuit communities contributes to high transportation costs for building materials. Ongoing maintenance and operation of adequate electricity, heating, water and wastewater services for rural and remote housing are technically demanding and expensive.

FIGURE 56

DISTRIBUTION OF FEMALE POPULATION LIVING OUTSIDE RESERVES BY HOUSEHOLD TYPE, 2001

Source: CMHC (Census-based housing indicators and data)

In addition, employment and skills development opportunities in the North have been limited.

People of other Aboriginal identities living in northern and remote areas also face housing conditions similar to those facing the Inuit population.

Challenges facing Aboriginal women

In 2001, 27.6 per cent of Aboriginal women living outside reserves were in households in core housing need, compared to 24.4 per cent of Aboriginal men and 12.3 per cent of non-Aboriginal women.

Aboriginal women living outside reserves are more likely to live in lone-parent households than non-Aboriginal women (see Figure 56). Lone-parent households relying on a single income are more likely to be in core housing need. Almost half (48 per cent) of Aboriginal lone-parent households are in core housing need. When comparing household incomes, Aboriginal women are twice as likely as non-Aboriginal women to live in a household with an income of less than \$20,000. Consequently, Aboriginal women are more likely to have difficulty affording acceptable housing.

Women on-reserve face additional housing challenges. For example, in marriage dissolution, provincial courts do not have the authority to award an interest in the matrimonial home, which is usually in the husband's or Band's legal possession. This often results in women having to leave the reserve, unless the community has a housing policy for such situations.

Women wishing to leave their living situation because of violence or relationship breakdown have limited housing alternatives on-reserve. Choices are restricted to staying in the current living situation, moving into another household that may already be crowded or leaving the community. If there is a woman's shelter, there may not be transitional housing that enables a move from an emergency shelter to stable and secure housing.

As with their counterparts on-reserve, the remote location and inadequate housing supply are obstacles for Inuit women wishing to leave relationships. The lack of housing alternatives limits the choices for Inuit women living in the North to staying in current housing, living temporarily with a family or friend or leaving the community.

Looking for solutions and establishing directions through the Canada-Aboriginal Peoples Roundtable

At the Canada-Aboriginal Peoples Roundtable on April 19, 2004, the Prime Minister discussed setting a new direction on Aboriginal policy and engaging in a new dialogue that would help improve the lives of Aboriginal people in Canada.

The housing sectoral session

Housing was one of the six sectors identified for further policy development. A housing session was held in November of 2004, in Ottawa, with 150 participants and officials in attendance, bringing together a broad range of housing perspectives, knowledge and expertise.

Some of the recommendations were:

- **Housing supply.** Funding and involvement of all levels of government and the direct involvement of Aboriginal people are required to create and administer housing policies and programs. Responses should recognize diverse urban, rural and northern needs and the needs of disadvantaged groups.
- **Housing quality.** Aboriginal people need a voice in the development of construction standards. Training and apprenticeship programs are required to ensure that Aboriginal people can build and maintain housing. Environmental concerns should also be taken into account and high quality, maintenance-free materials should be used in new construction and in upgrades to existing units.
- **Affordability.** Affordable housing is especially critical for the elderly, women, people with disabilities and the homeless. Affordable rental housing is also required. Homeownership could be promoted through innovative financing mechanisms geared to people living in poverty or with inadequate credit ratings. In addition, community approaches such as projects that involve sweat equity or some other form of contribution should be expanded.
- **Capacity development.** Information and support for occupants on maintaining their homes should be increased. Skills and trades training for individuals should cover housing activities such as construction, inspection, financing, administration and project management. Institutional capacity development opportunities for Aboriginal organizations should also be supported to assist organizations in taking greater control over housing.

Following the Roundtable process, a Policy Retreat was held on May 31, 2005 with federal Ministers and Aboriginal Leaders of the five National Aboriginal Organizations (NAOs) including the Assembly of First Nations (AFN), Inuit Tapiriit Kanatami (ITK), Métis National Council (MNC), Congress of Aboriginal Peoples (CAP) and Native Women's Association of Canada (NWAC). The purpose of the Policy Retreat was to bring closure to the Roundtable process and discuss the way forward on closing the gap in life chances between Aboriginal and non-Aboriginal people. At this meeting, Ministers and Aboriginal Leaders discussed a vision for increased Aboriginal control over housing and the need to work collaboratively on developing a new Aboriginal housing system.

In an effort to strengthen relationships and work collaboratively with various partners on improving the quality of life of Aboriginal people, a First Ministers' Meeting (FMM) on Aboriginal issues involving federal, provincial and territorial governments and Aboriginal Leaders is planned for November 2005. The meeting will include discussions on housing, health, education and economic opportunities.

Aboriginal initiatives

In spite of current housing challenges, various groups and communities have organized to develop innovative solutions. This section, while not comprehensive, describes some of these initiatives.

Good governance practices

Seabird Island First Nation in British Columbia developed a housing governance structure that consists of Chief and Council, a housing department and a housing committee that is responsible for analysing, reviewing and advising Council and consulting with community members. The structure is supported by clearly defined job descriptions with associated roles and responsibilities. Day-to-day operations are governed by policies and procedures about issuing Certificates of Possession, landlord-tenant relations and recourse mechanisms, among others.

Six Nations of the Grand River in Ontario has a housing committee with community representation that considers all housing-related issues and priorities before they go to Band Council. The community established a residential inspection policy to support good quality construction, specifically the ability of Six Nation inspectors to apply and enforce construction codes and standards. Inspectors are supported in their work by conflict of interest and other policies to ensure good quality house construction.

Community planning

The Coral Harbour Inuit community in Nunavut recognizes the benefits of community planning for the related economic benefits. The community developed a land-use plan that considered the community's social, cultural, housing, environmental and economic needs. The resulting economic benefits include establishment of commercial caribou harvesting, which has stabilized the community's economic base.

The Joint Community Planning Committee of 17 Atlantic First Nations, six federal government departments and Dalhousie University developed a comprehensive community planning model for small communities. It was tested in three First Nations, with the 13 First Nations participating in a capacity-building program to help develop experience and understanding of the process.

Housing policy development

The Gordon First Nation in Saskatchewan developed a housing plan that assesses housing needs in the community, develops strategies to address those needs and identifies related resource requirements and technical service support.

The Cayoose Creek First Nation in British Columbia established a housing policy process that addresses a range of housing needs and takes advantage of related economic benefits. Cayoose Creek First Nation created a row house project that accommodates a mix of seniors, singles, families and disabled persons. The design incorporated several culturally unique elements and was completed with the input of the community. Local materials and labour were used in construction.

Aboriginal management

The Aboriginal Housing Management Association (AHMA) Board, representing 14 Aboriginal housing societies in British Columbia, is a networking, educational, and advocacy organization. In 2001, AHMA developed a comprehensive framework to administer Aboriginal housing. In 2004, AHMA signed an agreement for the transfer of the provincial portfolio of Aboriginal housing outside reserves to AHMA member societies. In addition to property management, AHMA also coordinates training for Urban Native Housing Societies in cooperation with British Columbia Housing.

Corporation Waskahegen manages over 2,000 units for Aboriginals living outside of reserves in approximately 115 municipalities across Quebec through four non-profit organizations and two housing cooperatives. Waskahegen's services include program delivery, project management, architecture, construction, social and community services. Waskahegen operations also contribute to Aboriginal employment and economic development through construction and property management activities.

Aboriginal construction

Makivik Corporation is a non-profit organization created in 1978 and owned by the Inuit of Nunavik in northern Quebec. Makivik's construction division is involved in long-term construction planning and builds social housing. Makivik uses Inuit labour to the extent possible and enters into contracts with municipalities to use municipal heavy equipment, which contributes to local economies.

Quality construction and renovation

The Mohawks of the Bay of Quinte in Ontario created highly skilled, award-winning housing labour force, and units constructed in the community are built to R-2000 standards. In addition, the community tested alternative housing design techniques, including construction of smaller units directly targeted to its senior citizen members.

The Cree Regional Authority in northern Quebec joined with CMHC to train its inspectors in renovations. This three-part training ensures inspectors are up-to-date on techniques in renovation building science, including remediation of mold and energy efficiency.

The Lennox Island First Nation in Prince Edward Island approached the housing quality challenge proactively by incorporating R-2000 features in its units, along with resource and water conservation measures, use of recycled materials, passive solar heating, good indoor air quality and accessible living spaces.

Increasing ownership opportunities

The system of collective land ownership and lack of mortgage security can be an impediment to an efficient housing system on-reserve.

In response to this, communities such as Kahnawake in Quebec and the Mohawks of the Bay of Quinte and Six Nations of the Grand River in Ontario operate revolving loan funds and related land systems based on Certificates of Possession, allowing qualified homebuyers to gain title to the land and borrow directly from the First Nation without Ministerial Loan Guarantees.

In British Columbia, 11 Shuswap communities are planning to establish a housing market by using long-term leases under the *Indian Act* designation process. Under the proposal, Band members will receive a long-term lease that can be mortgaged. Most financial

institutions will accept long-term leases as security for a mortgage loan. Not only will these leasehold interests be transferable among Band members in one particular community, thereby establishing the beginnings of a housing market, but they will also be transferable to members of other Shuswap communities. This will further help establish a housing market.

After a series of community consultations The Lac La Ronge First Nation in Saskatchewan developed a homeownership program which includes an elected Housing Authority Board. Lac La Ronge has also entered into an agreement with a major bank, which will provide renovation loans to a total of \$500,000. At the same time, the bank established a pool of \$5 million to provide mortgage loans. Recipients of either renovation or mortgage loans must meet the bank's lending criteria. The loans do not need a Ministerial Loan Guarantee.

Home occupant involvement

Communities such as Six Nations of the Grand River in Ontario, Seabird Island in British Columbia, Mohawks of the Bay of Quinte in Ontario, and Cowichan Tribes in B.C. have lease or loan agreements with occupants specifying roles and responsibilities, including the need for occupant maintenance, payment obligations and eviction and appeal measures.

Home occupant education

Communities such as the Cowichan Tribes in B.C. sponsored training and information sessions for home occupants on such topics as home maintenance and indoor air quality. These sessions were a key part of the longer-term solution the community developed for mold remediation.

Westbank First Nation in British Columbia developed a community housing communication strategy to deal with operational issues that included improved internal communication and information processing, improved input through tenant meetings, and staff training. With a high tenant participation rate, a 50 per cent reduction in rental arrears was reported.

The Hobbema First Nation in Alberta introduced a tenant-training program. Potential occupants were required to attend a home maintenance program in advance of occupancy and, as part of that training, participants received information on maintaining their homes and were provided with basic home maintenance materials and tools.

Local economy

In New Brunswick, the Red Bank First Nation has begun work on a plan to allow it to take advantage of a recent court ruling allowing it to harvest timber for personal use on provincial Crown land. The community will use the timber to create business opportunities and jobs for its members. Red Bank is also working with a bank to secure homeownership loans for its members and to create a revolving loan fund.

Housing design innovations

Aboriginal Healthy Housing™ and Flexhousing™ initiatives⁷⁰

In many remote, rural, northern and First Nations communities, environmental degradation is becoming more and more apparent as permafrost melts and wildlife and forests disappear. At the same time, there is a greater recognition and understanding that housing can be a part of the problem.

FIGURE 57
KANATA 2000 MASTER PLAN

⁷⁰ For more information about CMHC's Healthy Housing™, see the chapter entitled "Healthy Housing and Sustainable Communities."

FIGURE 58
KANATA HEALTHY HOUSE

face south to catch the sun. Site planning preserves two streams and a wooded knoll and affords opportunities for local food production and safe play spaces, plus bird and small animal habitats. Such site layouts not only provide pleasant and healthy living conditions but are also critical to maintaining local ecosystems including indigenous plants and trees.

The initial Healthy House is made of wood-frame construction insulated with straw bales (Figure 58). It uses non-mechanical techniques to store passive solar heat in the floors and walls and incorporates an active solar hot water and slab heating system. Compressed earth-block interior wall construction was demonstrated to train local trades in alternatives to standard masonry and concrete.

Many First Nation communities are remote and have no access to an urban power grid or infrastructure, so they also need feasible approaches to energy efficiency. Many of these communities also have less access to finished materials and technological expertise and may still be dependent on traditional foods, materials and energy sources.

This combination of improved awareness, diminished resources and acute need has led to the development of Healthy Housing™ initiatives. Healthy Housing™ incorporates sustainable development concepts into the design of both Aboriginal and non-Aboriginal communities in Canada. Four Aboriginal examples are described below.

Kahnawake, Quebec

Kahnawake, a Mohawk community of 6,794 people on 4,856 hectares (12,000 acres) on the south shore of Montréal, has planned a sustainable neighbourhood for 32 healthy homes on a four-hectare (ten-acre) site remote from the community sewer infrastructure.

Known as the Kanata 2000 Healthy Housing Project (see Figure 57), the homes save land by being closer together than elsewhere in the community, minimizing the need for roads and allowing for family plots with future “granny homes.” This helps maintain the important social fabric of an Aboriginal community. At the same time, all homes have a high degree of privacy and improved solar access as all homes

Efficiencies from the alternative wastewater infrastructure are expected to offset the slightly increased cost of the energy-efficient upgrades to the building envelope, that is, the walls, roof and foundation.

Eagle Lake, Ontario

At Eagle Lake, an Objibway First Nation in North western Ontario, a Healthy House serviced by a completely portable infrastructure container was built close to the lake. Neighbouring communities, including Mishkeegogaming, Lac La Croix, Webeque and Big Trout Lake, have already adapted the house design and other innovations.

FIGURE 59
EAGLE LAKE HEALTHY HOUSE

FIGURE 60
EAGLE LAKE HEALTHY HOUSE - ECONOMAD™

This three-bedroom, slab-on-grade bungalow (see Figure 59) has R-50 walls, an R-60 attic, and 15 cm (six-inch) slab insulation, radiant floor heating and carefully chosen appliances and lights. The energy-efficient, passive solar home design (once again pointed south) reduces the need for the expensive infrastructure common in the North and makes it possible to consider alternative on-site infrastructure solutions for water, sewage, heat and power, such as the EcoNomad™.

The EcoNomad™ micro-infrastructure package is completely housed inside a 6 x 2.5 x 2.5-m (20 x 8 x 8-ft.) shipping container (see Figure 60). The unit uses a 90 per cent efficient, diesel or biodiesel-fuelled co-generator to supply both heat and power in one operation. It supplements this with micro-wind and solar power to minimize generator operation time in summer weather.

Potable water is obtained by biological purification of the lake water, plus special cartridge filtration and UV sterilization according to local water analyses. Sewage and greywater are processed by a separate biological treatment system (three-stage septic tank, plus a Waterloo BioFilter® followed by a back-flushable, slow-sand filter). This produces high-quality reclaimed water (no longer effluent quality) suitable for direct discharge through a

simple tile bed or, if desired and appropriate, for re-use for toilets and even laundry.

In many ways, this house mimics other natural ecosystem components by initially reducing its own needs and then supplying them as much as possible from renewable sources (wind, sun and earth). Where it does draw from other components, such as water, the house returns what it takes in as good or better condition that it was received.

Maniwaki, Quebec

This small pre-fabricated bungalow, 38 m² (400 sq. ft.), is ideal for northern and remote areas (see Figure 61). The design is strong enough to sustain wind and snow loads, yet lightweight and movable—truckable—and easy-to-build. It requires only basic construction skills, uses local materials and products, but is relatively labour-intensive to create local employment. Annual heating needs, including hot water, are met with a single cord of dry hardwood.

The Maniwaki Adult Education and Vocational Training Centre (Western Quebec Regional School Board) formed a project team. The team's vision was to make these houses cost-competitive with makeshift basement

FIGURE 61
MANIWAKI "MIGEWAM 24" HEALTHY HOUSE

and attic apartments so that low-income families and individuals could become proud homeowners and secure community members. The Migewam 24 (Migewam is the Algonquin word meaning "home"), reflects the traditional lifestyle and is designed by and for the Algonquin Indian population of Quebec.

The design is suitable for many secondary purposes, including for both summer and winter recreational use and also as an accessory apartment. The house lowers demands on the environment by being smaller and built with small-sized lumber from local, harvestable trees; it can be placed to suit site conditions without blasting, draining, clearing or altering natural features; it is energy efficient in that it reduces the need for costly infrastructure; and it can be assembled by anyone with basic construction skills or training. The lightweight, strong construction of these homes makes it possible to transport them to a site and place them between trees (see *Figure 61*) with very little site degradation. Homes can also be clustered to reduce the need for expensive and damaging roads.

Seabird Island, British Columbia

The Seabird Island Project, just outside Agassiz, is part of the Seabird Island First Nation's Sustainability Plan.

The homes at Seabird Island are extremely energy efficient as the earth, wind and sun supply heat and energy. Operating the homes is highly affordable—energy consumption is as much as 75 per cent less than a typical home—and the homes have been designed and calculated to have an estimated 100-year lifespan.

The concept of FlexHousing™, housing that is designed for adaptability, accessibility and affordability, is central to the Seabird Island sustainable housing.

Spaces are designed to evolve easily and with minimum expense as the needs of the people living in the house change. For example, some of the rooms in the Seabird Island demonstration homes are designed so that they can be easily subdivided as children's rooms, home offices or even self-contained units.

The home is barrier-free and everyone benefits from an accessible home—not just older people or people with special needs. For example, wider hallways in some of the homes make it easy to move furniture or a person in a wheelchair between rooms.

The house is relatively inexpensive to heat or renovate. Some features are slightly more expensive to install than standard features, but the initial expense is recovered over the long term.

Conclusions

Despite various initiatives to improve the situation, housing conditions of Aboriginal people remain well below those that most Canadians enjoy. Housing supply shortfalls, crowding, and inadequate housing reserves, in the North and in remote communities, are of particular concern. In urban areas, the incidence of homelessness among Aboriginal people is alarmingly high relative to that of non-Aboriginal people, and low incomes continue to affect the ability of Aboriginal people to access adequate housing.

Housing conditions have a direct impact on social, educational and occupational achievement, as well as on one's physical and mental well-being. In turn, these factors are linked to housing in that they further determine one's ability to access adequate housing. The Canada-Aboriginal People's Roundtable acknowledged that challenges vary between groups and between communities. Accordingly, responses to these needs and challenges must recognize and be flexible in accommodating these differences.

A key message heard throughout the Roundtable, and echoed at the May 31, 2005 Aboriginal Retreat is the need to increase Aboriginal capacity and control over housing and the need to strengthen relationships among federal, provincial, territorial and Aboriginal partners to work collaboratively on improving Aboriginal housing conditions. The First Ministers Meeting on Aboriginal issues scheduled for November 2005 is a key milestone to working towards this vision.

HEALTHY HOUSING AND SUSTAINABLE COMMUNITIES

This chapter explores how housing—everything from the design, construction and maintenance of houses and the equipment and appliances required to run them, to the design of entire communities—affects the environment. In a vast and cold country like Canada, the energy used to build and operate homes and to support current lifestyles represents a significant percentage of Canadians' total energy use. One byproduct of energy use is the release of harmful atmospheric substances, such as carbon dioxide and other greenhouse gases, which results in global warming. Other chemicals, such as chlorofluorocarbons, released in the operation of household mechanical systems also have a harmful effect on the protective ozone layer, the part of the earth's atmosphere that shields us from overexposure to the sun's rays. When total consumption of both renewable and non-renewable resources in the housing sector is reduced, these benefits directly accrue to the earth's natural ecosystems. This section reviews some of the initiatives undertaken to minimize our collective impact on the global environment.

Housing and sustainability

The construction, operation and maintenance of housing are all major consumers of resources. Because it has a long life, housing affects both energy consumption and various other key facets of our lives, such as transportation, infrastructure, community, employment and health. Well-constructed housing, therefore, can make a major contribution to sustainability and quality of life.

The environment

Housing is a man-made component inserted into the ecosystem. It can significantly affect the environment in ways that are not immediately self-evident. Because of this, an explanation of housing's impact on the environment is warranted.

When left undisturbed by external influences, an ecosystem's natural components (forests, wildlife and on), constantly sustain that system's balance by replenishing and restoring whatever is consumed or withdrawn.

Housing, developed without considering its potential effects on the ecosystem, affects this natural balance. Potential impacts can include increased runoff, loss of habitat, and excessive greenhouse (GHG) emissions.

Well-designed and well-built houses and neighbourhood developments can bring or maintain positive environmental outcomes by:

- conserving energy and resources,
- protecting sensitive environmental features, such as streams, woodlots and wetlands,
- repairing damaged or contaminated land, and
- providing infrastructure that supports transportation by alternative means other than the automobile, such as walking, cycling and public transit.

Housing affects health

The World Health Organization (WHO) includes housing and health in its list of environmental health indicators, recognizing that housing conditions can have an impact on occupant health. Establishing a direct cause-and-effect relationship, however, can be difficult, as health problems often reflect the combined cumulative effect of various factors.

Poor household hygiene, poor home air quality, improper space heating, inadequate maintenance and security practices, and exposure to noise, molds or harmful substances, can all negatively affect human health. Such conditions may affect not only physical health, but also social and mental health, particularly among children, the elderly and people with physical limitations.⁷¹

There appears to be a relationship between socioeconomic status, housing, and certain types of specific health risks. For example, children from poor families may be exposed to greater levels of lead because they are more likely to live in older, improperly maintained dwellings, potentially exposing them to lead-contaminated paint, dust and soil. At the same time, they are also more likely to have inadequate nutrition, making them more susceptible to increased absorption and retention of ingested lead.⁷²

Other building materials used in the construction of homes and their contents can also have deleterious effects on the household's occupants.⁷³ Furniture, carpets

and cabinets, for example, can release volatile organic compounds (VOCs).⁷⁴ The use of less toxic production materials can therefore benefit human health and result in fewer negative environmental effects.

Excess moisture in a home affects occupants' health

Mold grows when there is excess moisture. Mold spores exist virtually everywhere in our natural environment, but will also grow inside a house when there is too much moisture. Simple measures can often fix minor mold problems.

As many as 38 per cent of Canadian homes are damp or moldy.⁷⁵ Children are particularly susceptible to the health effects of mold, because they need more oxygen for their body weight than adults do and they breathe at a faster rate. As a result, they take in proportionately more air pollutants than do adults.⁷⁶

Although no determinative causal relationship has been conclusively established, studies indicate strong correlations between the presence of mold and its corresponding negative health effects. For example, children living in damp or moldy homes are 32 per cent more likely to have bronchitis.⁷⁷

Molds also pose significant problems in some First Nations communities for interconnected reasons, such as inappropriate housing design for their environment or lifestyle, poor construction, insufficient maintenance and inadequate ventilation.⁷⁸

What is mold?

Molds are microscopic fungi, a group of organisms that includes mushrooms and yeasts. Fungi grow and reproduce rapidly.

Molds grow if moisture and nutrients are available. High moisture levels can be the result of water coming in from the outside through the floor, walls or roof; from plumbing leaks; or moisture produced by daily activities, such as bathing, washing clothes and cooking. Water enters the building when there is a weakness or failure in the structure and moisture accumulates within the home when there is improper ventilation.

Mold and housing

Damage to materials (staining, discolouration) is one concern. Continued mold growth can be a sign that moisture conditions are favourable for the growth of fungi that cause wood rot and structural damage.

Molds release chemicals and spores and can be a source of health concerns. Health experts say that the effects of mold can range from insignificant to allergic reactions and illness, depending on the type of mold in a home, the amount and degree of exposure and the health of the occupants. Pregnant women, infants, the elderly and those with health problems, such as respiratory disease or weakened immune systems, are more at risk when exposed.⁷⁹

Transportation

Space heating accounts for most of the energy used in Canadian homes. At the broader community level, however, the greatest amount of Canadians' personal energy use, and therefore production of greenhouse gas

emissions, comes from a reliance on the automobile. In fact, passenger road transportation (as opposed to freight transportation) is responsible for half of Canadians' total output of the GHG emissions associated with personal use (see Figure 62).

A more sustainable approach, therefore, necessarily includes effective community planning that reduces commuting distances or perhaps even eliminates the need to commute. Creative alternative housing arrangements, which reduce transportation-related greenhouse gas emissions, can reduce the need to build and maintain costly road infrastructure.

It is not even always necessary to resort to new development to achieve progress. One CMHC study found that infill developments that increase housing density are more effective at lowering transportation-related GHG emissions than "greenfield" development specifically designed to reduce car dependency.

Financial costs

There are also hidden indirect financial costs to current housing development practices. Research has shown, for example, that the effects of air pollution—from burning fossil fuels for heating and cooling homes and from driving—on human health can be dramatic.

FIGURE 63
ENERGY USE AND GREENHOUSE GAS EMISSIONS (GHG)
BY SECTOR, 2003

Source: Natural Resources Canada (NRCan): *Energy Efficiency Trends in Canada, 1990 to 2003*

According to the Ontario Medical Association, in 2005, air pollution will result in 5,800 premature deaths and will cost the province of Ontario almost one billion dollars.⁸¹

The cost to build and maintain additional infrastructure also restricts municipal budgets and hampers municipalities' capacity to fund social, cultural and health services. Developers also face rising costs to extend infrastructure—costs that are ultimately passed along to consumers. Continually expanding infrastructure can open the door for inefficient development.

The Kyoto Protocol and residential energy use

When fossil fuels, such as coal, oil and natural gas, are burned, they release greenhouse gases⁸² into the air and thus contribute to what is known as global warming, or the greenhouse effect associated with climate change.

In December 2002, Canada ratified the Kyoto Protocol, a treaty aimed at reducing GHG emissions from the more-developed nations. In February 2005, that treaty came into effect. As one of the signatories, Canada is committed to reducing its emissions to six per cent below 1990 levels over the period 2008-2012.⁸³

As noted previously, GHG emissions are associated with burning fossil fuels. However, even a seemingly cleaner energy source such as electricity indirectly produces emissions. In 2002, Canada generated 28 per cent of its electricity from fossil fuels, up from 22 per cent in 1990.⁸⁴ An examination of the overall environmental impact of housing must therefore also include the role of electricity in the total energy mix.

In 2003, the residential sector accounted for 17 per cent of Canada's total energy use and 16 per cent of the country's GHG emissions (see Figure 63).⁸⁵ Total emissions from all sectors increased by

FIGURE 64
CHANGE IN ENERGY USE AND GREENHOUSE GAS EMISSIONS (GHG) DUE TO ACTIVITY, WEATHER, STRUCTURE AND ENERGY EFFICIENCY, RESIDENTIAL SECTOR, CANADA, 1990-2002

* "Activity" reflects changes in the number of households and the floor space.

** "Structure" reflects the mix of end uses, i.e., the relative energy shares of water heating, lighting, space heating and cooling, and other appliances and equipment.

FIGURE 65
RESIDENTIAL ENERGY USE BY PURPOSE, 2002

Source: NRCan, *Improving Energy Performance in Canada: Fiscal Year 2003-4*

23 per cent between 1990 and 2003, while increases in residential GHG emissions and energy use were somewhat lower, at 15 per cent.⁸⁶

Several factors can contribute to increases in residential energy use and GHG emissions: seasonal temperature fluctuations; lifestyle; household design and appliances and equipment; dwelling type (structure); the number and size of homes, their integration into the community; and their relationship to the local environment.

While Canadian summer and winter weather patterns in 2002 were more extreme than those in 1990, the impact of weather on residential energy use and GHG emissions was relatively small (*see Figure 64*).

By far the largest impact came from the 21 per cent increase in the number of households, and the 27 per cent increase in average total floor area. This accounted for over 80 per cent of the increase in residential energy use and corresponding GHG emissions between 1990 and 2002.

Energy efficiency

The increasing size of Canadian houses mentioned above decreases the overall efficiency of energy use in the residential sector. While energy use per square metre

decreased by 12.6 per cent between 1990 and 2003, energy use per household decreased by only 8.5 per cent. This is so because while newer homes are more efficient, they are also larger and better equipped, and thus require more energy to operate. In the same period, total energy use by housing increased by 13 per cent. Since the majority of a home's energy use in Canada is taken up in heating the home, a larger house uses a lot more energy (*see Figure 65*).

Nonetheless, the increase in residential energy use between 1990 and 2003 was only 40 per cent of what it would have been without the progress made in efficiency.

Energy efficiency encompasses everything from better performance of new and existing homes to more efficient household appliances. Helpful improvements can range all the way from small-scale upgrades of heating equipment to large-scale developments in construction techniques that improve the quality of a home's building envelope (the exterior elements of the house such as the roof, walls and foundation).

Space heating accounts for 59 per cent of residential energy use (*see Figure 65*). The overall efficiency of space heating is also influenced by the performance of the building envelope. Developments in construction techniques and building materials have significantly improved the energy efficiency of homes. On average, houses built between 2001 and 2004 use approximately half the amount of energy compared to those built before 1946 (*see Figure 66*).

In Canada, the ENERGY STAR[®] label provides efficiency ratings for most major household appliances, windows, gas fireplaces, and heating, ventilation and air conditioning equipment. This helpful comparison information encourages manufacturers and consumers to shift to higher-efficiency models.

86 However, when transportation energy and GHG emissions related to community design and location are considered, the contribution of housing to climate change is even more significant.

87 *Energy Use Handbook*, Natural Resources Canada, June 2005.

88 Ontario is testing ENERGY STAR[®] for New Houses in 2005. New homes that receive the ENERGY STAR[®] label will be 40 per cent more efficient than those built to minimum Ontario Building Code standards.

FIGURE 66

AVERAGE ENERGY CONSUMPTION BY AGE OF DWELLING, CANADA, PRE- 1946 TO 2001-2004

R-2000 is performance standard developed by NRCan for energy-efficient new houses.

Source: NRCan, *Improving Energy Performance in Canada: Fiscal Year 2003-4*

In 2001, ENERGY STAR® appliances accounted for 12 per cent of all sales of refrigerators (up from one per cent in 2000), 9.7 per cent of dishwashers, (up from 1.6 per cent in 2000) and 9.2 per cent of clothes washers (up from 2.2 per cent in 2000).⁸⁹

Natural Resources Canada's *EnerGuide for Houses* program rates homes on environmental features and gives homeowners specific advice on how to improve energy efficiency. In 2003–2004, about 48,000 homes were evaluated. Householders who retrofitted their homes reduced energy consumption by between 20 and 38 per cent, and total household carbon dioxide emissions by an average of four tonnes per year per house.⁹⁰

R-2000⁹¹ is a Canadian performance standard for new houses, which was designed to promote cost-effective, energy-efficient building practices and technologies. Houses built to the R-2000 standard generally outperform houses built to national, provincial and territorial building code standards in terms of energy efficiency.

R-2000 houses are healthier because they incorporate more comprehensive ventilation systems and low-emission building materials and finishes to ensure superior indoor air quality.

As indicated earlier (see Figure 66), a house that meets the R-2000 standard improves even further on the significant conservation gains of modern homes by consuming 36 per cent less energy than the average house built between 2001 and 2004, and 66 per cent less than a house built before 1946.

More than 10,000 R-2000 homes have been built in Canada, although this number as a relative share of total housing production is small. Between 2000 and 2003, R-2000 housing starts totalled 300 to 400 annually, down from an average of over 1,200 between 1992 and 1993. Even though production rates have declined since then, the R-2000 program can be credited with advancing energy-efficiency standards, codes, technologies and practices for all residential housing.

Mortgage loan insurance

The Government of Canada actively promotes energy conservation and provides initiatives to help Canadians reduce greenhouse gas emissions. CMHC, Environment Canada and Natural Resources Canada work together to tell Canadians about the benefits of such programs as *EnerGuide for Houses*, Canada's *One-Tonne Challenge*, and *Mortgage loan insurance for energy-efficient homes*.

If a householder buys an energy-efficient home or renovates an existing home to make it more energy efficient, and obtains a CMHC-insured mortgage, the homeowner may be eligible for a ten per cent premium refund on the mortgage loan insurance premium.

⁸⁹ Natural Resource Canada, National Energy Use Database.

⁹⁰ Natural Resources Canada, *Improving energy performance in Canada—Report to Parliament under the Energy Efficiency Act 2003–2004*.

⁹¹ The R-2000 standard is based on an energy consumption target for each house and a series of technical requirements for ventilation, airtightness (to ensure fewer drafts), insulation, choice of materials, water use and other factors.

Brownfield redevelopment

Other factors, such as brownfield redevelopment and street design can also affect housing types, density, transportation options and community design, as well as reduce ecosystem demands and degradation.

Brownfields are abandoned, vacant, derelict or underutilized commercial and industrial properties where past actions have resulted in actual or perceived contamination, and where there is an active potential for redevelopment.⁹² Most are located within urban areas where infrastructure such as roads, water, hydro and sewer lines already exist. There may be as many as 30,000 brownfield sites in Canada.

Brownfield redevelopment⁹³ can offer a broader range of housing types close to amenities and transportation in urban settings. These developments have been shown to reduce transportation costs compared to undeveloped, or greenfield, land. Remediation and redevelopment of brownfield sites for housing could allow communities to meet a number of sustainable development goals, including:

- meeting local housing needs,
- preserving historic or locally significant structures,
- cleaning up contaminated soil and water to improve the local environment, thus protecting human health,
- encouraging economic development,
- revitalizing existing neighbourhoods and stimulating design of new and innovative neighbourhoods,
- potentially significantly reducing commuting distances for those residents who choose to live closer to where they work, and
- curbing urban sprawl.

Street patterns

Researchers have examined ways to design communities so that they are more energy efficient. Community design determines the shape of a subdivision, the opportunities for pedestrian and vehicular traffic and ecosystem retention, and the requirement for costly infrastructure. Street patterns are the framework for community design.

The “fused grid” street pattern combines two of the North American approaches to residential subdivision design: the traditional 19th century curvilinear pattern of looped streets and modern suburbia (see Figure 6).

The goal of a fused grid is to combine the benefits of use of a conventional curvilinear pattern with the freedom of movement and activity of a grid. This combination provides a balance between the movement of pedestrians and cars. It creates natural spaces and improves street connectivity to community facilities. The design benefits too. The design saves on infrastructure requiring 30 per cent fewer streets, sidewalk and sewers.

FIGURE 6
THE FUSED GRID STREET PATTERN
COMPARED TO CONVENTIONAL
SUBDIVISION DESIGN

92 National Roundtable on the Environment and the Economy, *National Brownfield Strategy for Canada*, 2003.

93 *Brownfield redevelopment for housing: Literature review and analysis*, CMHC Socio-economic Research Highlight 05-013, CMHC, April 2005 or the full report by Luciano Piccioni, RCI Consulting, with Richard DiFrancesco of Regional Analytics Inc.

Compared to the traditional grid design, the fused grid also provides 19 per cent more building area because of this 30 per cent reduction in infrastructure.⁹⁴

Less infrastructure usually means lower building costs per home, thereby providing cost-savings benefits to both developers and homebuyers. The fused grid also creates an eight to twelve per cent increase in public green space, a quality-of-life benefit for residents, and slight increases (10 to 15 per cent) in population density.

Planning for sustainability

The impact that poorly designed houses and communities have on the environment is increasingly being recognized as unsustainable. Many Canadian and international communities have established guidelines, plans and development approaches to reverse these effects and to establish better living conditions for all residents.

CMHC supports sustainability planning principles in various ways, including ongoing research projects and knowledge transfer activities. CMHC's *Sustainable planning and development for small communities*⁹⁵ workshop series, for example, provides practical approaches and decision-making tools for sustainability planning. The workshops include information about sustainable development concepts, transportation, energy and materials management and housing and community policy and regulatory tools.

Net-zero energy healthy housing

Canada is now embarking on initiatives aimed at transforming new housing developments into sustainably planned communities.

In July 2005, CMHC contributed \$1 million to launch the first phase of a Canadian net-zero energy healthy housing initiative. This partnership between government and industry was fostered to build a vision for more energy-efficient, healthier future communities.⁹⁶

A net-zero energy home, like most homes, is connected to the utility grid, but produces at least as much energy as the house consumes in a year. Net-zero energy healthy housing (NZEHH) follows CMHC's five Healthy Housing™ principles (occupant health/comfort, energy efficiency, resource conservation, environmental impact, and affordability) by combining passive solar, energy-efficient design, construction and appliances with commercially available renewable energy systems.

Benefits include:

- Security—a home that produces energy protects its owner from fluctuations in energy prices.
- Reliability—a net-zero energy home can continue functioning even during blackouts.
- Improved comfort—an energy-efficient building envelope reduces temperature fluctuations.
- Environmental sustainability—these homes use fewer resources such as land, water, materials and infrastructure, save energy, and reduce pollution.

Technology is already available for homes to achieve net zero energy. In many countries, these principles are already in practice. Notable examples exist in the Netherlands, the United Kingdom, Germany and Japan.

On an individual home-by-home basis the ultimate sustainability goal is a net positive energy house that would produce a surplus of energy beyond its own energy requirements, treat its own water, and so on, and share these processes as a community system similar to that of natural ecosystem elements.

At a community level, NZEHH principles can be extended to include entire communities. Such a community would be able to eliminate its energy demands from outside sources and be completely self-sustaining while restoring its own local ecosystem.

The initial capital cost of designing and building an energy-efficient house is often slightly higher than the initial cost of a conventional house. However, through

94 For a comparison of a specific site, the Stratford Ontario Plan is described in *The Wharton Real Estate Review*, 4.1 (2005) 17-25.

95 <http://www.cmhcschl.gc.ca/en/imquaf/hehosu/sucopl/index.cfm>

96 CMHC, *Minister Announces Funding for Sustainable Housing*, July 20, 2005. www.cmhc-schl.gc.ca/en/News/nere/2005/2005-07-20-1000.cfm

Sustainable standards

LEED® (Leadership in Energy and Environmental Design®) is an optional set of performance standards provided for the design, construction, and operation of buildings. Currently, LEED® applies only to commercial and multi-family residential buildings, and not to single-detached dwellings.

In 2004, the City of Vancouver officially adopted LEED® as the standard for all new civic buildings greater than 500 m² (5,382 sq. ft.).⁹⁷ It also mandated energy requirements to ensure a 30 per cent reduction in current levels of energy use in all new civic buildings.

proper planning and a comprehensive, or systems approach to construction, the added costs can be more than offset with savings in infrastructure, savings on mechanical systems and significant ongoing savings generated from reduced energy, health and environmental costs.

CMHC's Healthy Housing™

To facilitate positive links between housing development and protection of the ecosystem, CMHC developed Healthy Housing™, a concept that envisions housing and communities that are healthy for both the home's occupants and for the planet as a whole.

Like NZEHH, the Healthy Housing™ concept is based on CMHC's five healthy housing principles. These principles can be applied to all housing forms, styles and price ranges. Homes appropriately scaled to an occupant's needs are cheaper to own and operate. They can also incorporate flexible and adaptable design or FlexHousing™ solutions.

FlexHousing™ incorporates, at the design and construction stage, the ability to make changes easily and with minimum expense, to meet the needs of its occupants. This allows occupants to occupy a dwelling for longer periods over their entire lifetimes, while adapting to changing circumstances and meeting a wide range of needs.

Healthy Housing™ principles and identifying key questions, such as:

- Do our communities have to be healthy to be successful?
- Can we protect our farmland, forests and ecosystems?
- Is it possible to build quality housing that is affordable?

Healthy Housing™ minimizes the use of resources, materials and energy in its operation. It encourages a nature to maximize efficiency from design, construction technologies and practices. This allows for greater flexibility and lowers costs. Healthy Housing™ encourages development that relies more on renewable energy sources and locally available materials. An Aboriginal feature in this edition of *Housing Observer* profiles examples of Healthy Housing™ and FlexHousing™ in several communities.

Optimal construction and operation of housing is especially important in the North, where energy and maintenance costs are often higher than elsewhere in Canada.

Conclusion

Sustainable community infrastructure can deliver clean air and water to healthy homes, receive waste and wastewater, restore air, water and soil to its original pristine state and then return those elements to the ecosystem.

Most homes built today should adequately house Canadians for 50 years or more. Properly designed, constructed and maintained houses in well-planned new and existing communities need consume only a reasonable quantity of resources to provide a high-quality living environment for generations to come.

Many lessons in this regard have been learned. Concepts for greater sustainability are continually being explored and implemented at every level to benefit the ecosystem, the community, and even individual homes. These initiatives will reduce housing's impact on the environment, facilitate less resource-intensive development, and create healthier living conditions for Canadians.

AFFORDABILITY

Most households successful in finding acceptable housing

In 2001, based on estimates from the Census, almost seven in ten Canadian households lived in acceptable housing—that is, affordable, uncrowded housing in good repair. CMHC estimates that another 16.3 per cent could have obtained acceptable housing at a cost of less than 30 per cent of before-tax household income (see Figure 68).

This left 13.7 per cent of Canadian households living in core housing need because they were unable to find acceptable housing.⁹⁹ This was down from 15.6 per cent in 1996, when labour force participation fell to a low for the decade. It was almost as low as the 13.6 per cent level of core housing need measured in 1991.

Though improvements in the economy in the late 1990s helped ameliorate housing conditions, in 2001 high proportions of Aboriginal, lone-parent, unattached

Includes only private non-farm, non-band, non-reserve households with incomes greater than zero and shelter cost-to-income ratios (STIRs) less than 100%.

Source: CMHC (Census-based housing indicators and data, revised 2005)

99 Some households classified as living in core housing need may be living in acceptable housing, but are unable to obtain it because of high shelter costs as part of a rent-geared-to-income program.

100 Tables of revised housing conditions data are contained in the Appendix of *Measuring Success: Reviewing Government Performance* of the *Canadian Housing Observer 2005* at www.cmhc.ca.

Core housing need estimates revised

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace the core housing need statistics in previous editions.

During verification of ongoing research, CMHC found that some households had been misclassified when Statistics Canada applied core housing need to both the 1996 and 2001 Censuses.

The misclassification overestimated core housing need for both the 1996 and 2001 Censuses.

The misclassification does not affect 1991 Census data.

There is more information about the effect of the misclassification at:

www.cmhc-schl.gc.ca/en/about/whwedo/whwedo_021.cfm

individual and recent-immigrant households—especially renters—still remained in housing need (see *Figure 69*).

Renters are over-represented among those in core housing need. While 28.3 percent of renters were in core need, the comparable figure for owners was 6.6 percent. Rental households account for over two-thirds of those in core housing need.

This chapter analyzes housing affordability by household income to shed further light on the persistence of housing need in Canada.

Income limits housing choice

Household income limits housing choices for most households. For households with the lowest incomes, their income stream completely governs the housing choice. Households with successively higher incomes have more options. For them, choice involves balancing many competing considerations. These may include job location; family size, composition and circumstances; and dwelling and neighbourhood amenities. They then balance their preferences against their financial resources, which include current income, future income prospects and accumulated wealth. For Canadian homeowners, wealth is most often held as equity in their current housing. That equity can then be redeployed to obtain a dwelling which better suits preferences.

The affordability of the final housing choice is measured by a household's "shelter cost-to-income ratio" (STIR).

Average Canadian is well-housed

According to the Census, there were 11.6 million private households in Canada in 2001. The Census collected information about the cost of shelter for 11.3 million non-farm, non-reserve households. Of these 11.3 million households, 10.8 million reported positive incomes and interpretable shelter cost-to-income ratios, which are the basis for this chapter's examination of housing conditions and affordability.¹⁰¹

In 2001, the average Canadian household was twice as likely to own as it was to rent and spent one-fifth of its \$61,000 before-tax income on housing.

This image can, however, be misleading, as many Canadians experience shelter cost-to-income ratios far from the average. For example, the 14 per cent of households with the highest incomes, averaging almost \$155,000, own their homes nine times out of ten and spend just 10 per cent of their income on housing (see *Figure 70*).

101 In the 2001 Census, just under 474,000 non-farm, non-reserve households reported information which, if used to measure housing affordability, results in STIRs showing that the households spent more on shelter than their income. In fact, the data they reported depicts them as spending on average over six times their 2000 incomes to pay for their 2001 shelter costs. CMHC cannot interpret the STIRs of these households and therefore excludes them when examining housing affordability and estimating core housing need. As the Census collects shelter costs being paid by the household in the month of the census, but collects incomes for the previous complete calendar year, the comparison of one to the other may result in very high STIRs for a small percentage of households whose circumstances changed notably between the two reference periods.

FIGURE 69
SHARE OF TOTAL HOUSEHOLDS COMPARED WITH
SHARE OF HOUSING NEED, CANADA, 2001

Source: CMHC (Census-based housing indicators and data, revised 2005)

At the other end of the spectrum are the 16 per cent of households with the lowest incomes—under \$20,000 a year. Close to two-thirds of these households rent their homes and have incomes so far below \$20,000 that most cannot find acceptable housing and are in core housing need. Housing for those in core housing need is the focus of this chapter.

Unacceptable housing has a strong income dimension

The poorest households in Canada in 2001 occupied the bottom half of the lowest income group. They reported less than \$10,000 in income and, compared to the average Canadian, were much more likely to be lone parents, Aboriginal persons, or both, and much more likely to rent their home. Four out of five households with less than \$10,000 in income were in housing need. They were 3.6 times more likely than other Canadians to be unattached

people under 65 years old. Indeed seven in ten were non-elderly individuals.

Many of these non-elderly individuals were not in the labour force and were dependent on income security programs. With the shelter component of social assistance often being well below the actual cost of shelter, they were therefore two to three times more likely to be in core housing need than their counterparts in the labour force.¹⁰² Based on their income, their housing problems are understandable.

The National Council of Welfare says single employable people are consistently the most impoverished of all welfare recipients, living off transfers in 2001 amounting to only 20 to 37 per cent of Statistics Canada's Low Income Cut-offs.

102 CMHC research using both 1991 and 2001 Census data has come up with similar findings: people not in the labour force and dependent on government transfers for their major source of income are two to three times more likely to be in core housing need than people in the labour force who are not as dependent on government transfers.

103 Statistics Canada's Low Income Cut-offs represent the level of income below which families or single persons would have to spend a disproportionately large percentage of their income for the basic necessities of food, shelter and clothing; this level is set at 20 percentage points more than the average Canadian's level of expenditures for basic necessities. The National Council of Welfare compares welfare recipients to Low Income Cut-offs to document both the inadequacy and deteriorating state of welfare incomes, especially those of single employable people. National Council of Welfare Reports, *Welfare Incomes 2003*, Volume 121, Spring 2004 Minister of Public Works and Government Services Canada, pp. 58-69.

FIGURE 71
HOUSEHOLDS IN CORE NEED
BY INCOME CATEGORY, CANADA, 2001

Dependent on welfare payments, households in the bottom income bracket—incomes averaging \$7,252—were unable to benefit from the improving economy in the 1990s. Four in five of these lowest-income households were in housing need in 2001. Figure 71 profiles the total number of households in core housing need in Canada by income category.

Six in ten households in the \$10,000 to \$20,000 income bracket experience housing need

The story is at once similar yet different for households in the top half of the lowest income group—with incomes between \$10,000 and \$20,000. Though renters, Aboriginal households, lone-parent households and unattached individuals under 65 were also over-represented in this income category, this group is particularly distinguished by a high proportion of elderly individuals. Indeed, while elderly individuals constituted just 9.8 per cent of all Canadian households in 2001, they comprised 43.9 per cent of households in the \$10,000-to-\$20,000 income bracket.

The concentration is not surprising. While federal Old Age Security (OAS), Guaranteed Income Supplement (GIS) and Canada or Quebec pension payments leave them modestly better off than their counterparts under 65, the National Council of Welfare has concluded that none of these programs by themselves will lift an unattached senior or senior couple out of poverty.¹⁰⁴

As a result, almost six in ten households in the \$10,000-to-\$20,000 income bracket were in core housing need in 2001 (see Table 22 in the Appendix, Key Housing Statistics).

Ninety-seven per cent of renters earning less than \$20,000, and in housing need, have affordability problems

Core housing need arises in any one of three circumstances: inadequate housing (that is in need of major repair); unsuitable housing (overcrowded); or unaffordable housing (too expensive relative to household income). In every case, to be defined as a household in core need, that household must also be unable to afford alternative housing that does meet proper standards. In terms of type of need, 97 per cent of all renters in need in the two under-\$20,000 income brackets had affordability problems. They spent 30 per cent, and often much more, of their low incomes on housing. Many also lived in dwellings too small for their household size or in dwellings in need of major repairs.

Overall, only nine per cent of all renter households in need paid less than 30 per cent of income for housing. But these households were still in need, because they lived in crowded or inadequate housing and could not have obtained housing which meets their needs without incurring affordability problems. Of the one million renter households in core housing need, three-quarters had incomes of less than \$20,000 (see Table 23 in the Appendix). Nearly half of them spent 50 per cent or more of their average income of \$12,600 on housing alone. Because of their slightly higher levels of income support, the proportion of senior renters spending 50 per cent or more of their income on housing was slightly less, at just under one-third.

Housing need falls to one in five households at incomes of \$20,000 to \$30,000

Households in the next income bracket—with incomes between \$20,000 and \$30,000—were almost evenly split along tenure lines, with 52 per cent owning and 48 per cent renting. The proportion of these households that are Aboriginal, lone-parent or unattached individuals under 65 is also much closer to the figures for all Canadian households.

104 National Council of Welfare Reports, *Poverty Profile 2001*, Volume 122, Autumn 2004, Minister of Public Works and Government Services Canada, page 58.

Housing need in this income bracket falls to one in five households (see Table 22 in the Appendix). Among those in need at the bottom end of this income bracket are recent-immigrant, urban renters who arrived in Canada in the last five years. Eighty per cent of these are family households living on incomes averaging \$22,895, of which they paid half on housing. These households experience housing problems for some of the same reasons as unattached individuals under 65 with incomes under \$10,000. Specifically, the vulnerability of recent-immigrant renters to housing instability and need is linked to their initial difficulty in finding suitable work and to their low incomes resulting from a preliminary dependency on income-support programs.¹⁰⁵

Housing need drops off sharply at higher income levels

Within the \$40,000-to-\$50,000 income bracket, the tenure split reaches the Canadian average of two-thirds owners to one-third renters. Canadian households most vulnerable to core housing need, notably Aboriginal, lone-parent, and non-elderly households, are now all found in average proportions. Elderly households in this income range are under-represented relative to their share of all Canadian households, and core housing need for the income group overall falls to three per cent (see Table 22 in the Appendix). Above this income level, ownership predominates and household types particularly prone to being in housing need fall to well below average proportions and the percentage of households in core need falls to zero.

Differences in the pattern of core need incidence by tenure

There are significant differences between renter- and owner-income distributions when it comes to core need. These differences merit closer examination.

Matching tenure charts of the distribution of households by income and core housing need show how need peaks much higher for renters than owners in the lowest-income levels but falls off more quickly for renters than owners in the higher-income levels (see Figure 72).

Interestingly, in the very lowest income bracket \$10,000 and less—eight in ten households fall into housing need regardless of whether they own or rent their homes (see Table 22 in the Appendix).

Very few renters or owners were in housing need when the household's income reached \$40,000 or more in 2001. In fact, just 1.4 per cent of renter households and 0.4 per cent of owner households with incomes of \$40,000 or more were in housing need (see Figure 72).

Some postulate that certain Canadian households, currently classified as being in core housing need, may be income-poor but asset-rich. The next section examines this hypothesis. With housing itself being the most widely held asset class in Canada, the investigation starts by looking at home value and equity before looking at other household assets.

Core housing need and home value

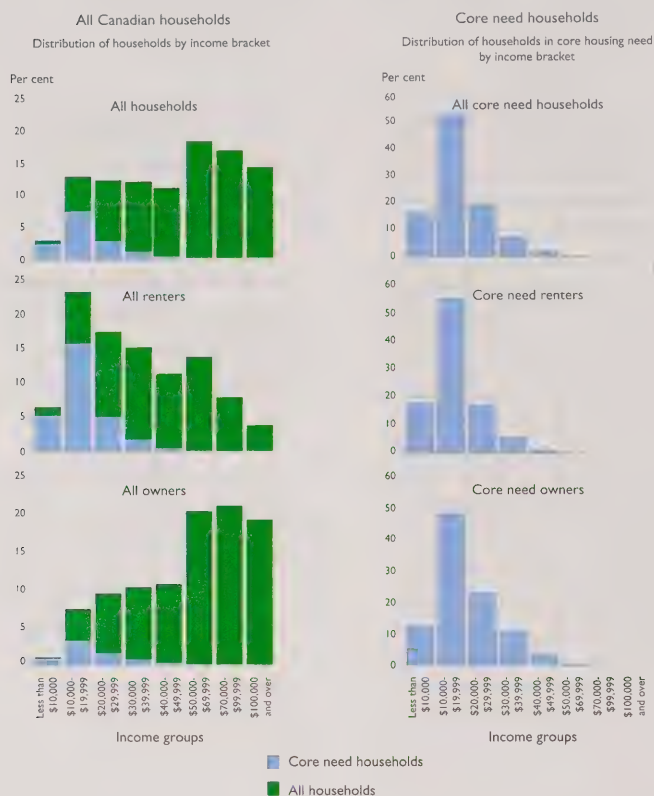

Though the Census does not collect data on household assets and debts, it does ask homeowners for the estimated value of their dwellings. While owners in housing need have relatively low incomes, over one-third (38.7 per cent) reported living in dwellings they estimated as averaging \$150,000 or more in value in 2001. Two-thirds of these owners were under 65 and had mortgages while a small number were seniors with mortgages. Both of these groups are examined further in the next section, using 1999 *Survey of Financial Security* (SFS) data to determine whether they might have been able to gain enough equity from their homes to rent acceptable housing without being in housing need.

Twenty per cent of owners in housing need living in dwellings they estimated as averaging \$150,000 or more in value were mortgage-free. Comprised of 18,395 seniors and 20,115 non-seniors—38,510 or 8.1 per cent of all owners in housing need—these households possessed considerable home equity which, if converted into income-producing assets, could possibly have enabled them to rent acceptable housing without being in core housing need. Using 1999 SFS data, the next section examines the complete asset profile of these mortgage-free owners and all other households in housing need to gain a deeper understanding of their financial security.

FIGURE 72

CORE HOUSING NEED BY TENURE AND HOUSEHOLD INCOME, 2001

Includes only private non-farm, non-band, non-reserve households with incomes greater than zero and STIRs less than 100%.

Source: CMHC (Census-based housing indicators and data, revised 2005)

Few in housing need have the wealth needed for security

The first and most obvious finding from the financial profiles of households who were in housing need because of affordability problems is that renters with housing affordability problems have little or no wealth (see Figure 73).

Possessing, on average, only \$21,000 in net worth, they had few assets to draw on to alleviate their housing problems. Indeed, seniors—the best off of the needy renters—averaged only \$41,000 in net worth.

Their low net worth indicates that employer pensions were probably not a significant contributor to their financial security. With only \$22,000 in liquid assets, they also had little in investments, RRSPs or RRIAs. Their financial profile corroborates evidence offered earlier that senior renters in need are mainly dependent on public pensions and income-support programs.

Census data show that 183,535, or 38.7 per cent of owners in housing need, were in income brackets \$20,000 and up and lived in dwellings for which the average value was \$150,000 or more (see Table 24 in Appendix). Four-fifths of these owners in need had

FIGURE 73
HOUSEHOLDS WITH AFFORDABILITY NEED BY TENURE, INCOME, HOME EQUITY,
NET WORTH, AND LIQUID ASSETS, CANADA, 1999

Tenure and age	Average income	Average home equity	Average net worth	Average liquid assets
Owner with mortgage	\$21,000	\$62,000	\$146,000	\$27,000
Non-senior	\$21,000	\$60,000	\$143,000	\$28,000
Senior	\$20,000	\$85,000	\$170,000	\$16,000
Owner mortgage-free	\$13,000	\$149,000	\$310,000	\$77,000
Non-senior	\$12,000	\$140,000	\$318,000	\$78,000
Senior	\$15,000	\$160,000	\$300,000	\$77,000
Renter	\$15,000	-	\$21,000	\$10,000
Non-senior	\$15,000	-	\$15,000	\$6,000
Senior	\$15,000	-	\$41,000	\$22,000

Net worth refers to the sum of a household's equity in their home (for the 36% of households in need which own their homes), retirement assets (value of employer pensions plus RRSPs and RRIIs), financial investment assets, and other assets including business equity, vehicles, secondary property and household effects. Households with negative net worth after debt are included in the computation of average net worth.

Liquid assets refers to the sum of only those assets which can be readily converted into cash. They include only RRSPs, RRIIs and financial investments.

Source: CMHC (estimates derived from Statistics Canada's 1999 Survey of Financial Security)

mortgages, however the sizes of these mortgages were unknown, making it impossible to determine from Census data if they had any substantial home equity. The 1999 SFS estimates of households with housing affordability problems helps us overcome this Census data gap to show that:

- non-senior owners in need who had mortgages averaged just \$60,000 in home equity, and
- senior owners in need with mortgages averaged only \$85,000 in home equity.

It therefore appears that neither group had enough home equity to say without doubt that they could have avoided being in housing need if it they had converted to renting and redeployed their resources.

Outside of home equity, these groups possessed, on average, just \$83,000 to \$85,000 of other wealth (derived from Figure 73).

Aside from any home equity and wealth invested in inaccessible pension assets, non-senior owners in need with mortgages had just \$28,000 in available liquid assets and senior owners with mortgages just \$16,000 in available liquid assets. In conclusion, they had very limited resources available to resolve their housing problems.

As mentioned, however, the Census shows that 8.1 per cent—38,510—of all owners in housing need were mortgage-free and lived in dwellings they reported as

averaging \$150,000 or more in value. Examining the best possible match for this group of owners in need using the 1999 SFS, Figure 73 shows that, in addition to having equity in their homes averaging around \$150,000 (more for seniors than non-seniors), these households also had about \$160,000 of additional wealth.

Excluding wealth vested in inaccessible pension assets but including home equity, mortgage-free non-senior and senior homeowners in housing need averaged, respectively, \$218,000 and \$237,000 in assets (derived from Figure 73). This group would probably have been able to stave off being in housing need had it chosen to rent, rather than own, acceptable housing.

The housing affordability challenge

Though the housing circumstances of households in core housing need vary, low income remains the crux of the problem for most. For some, such as those in the less-than-\$10,000 income group, it is a severe problem; for others, more marginally so.

Analyses using the 1999 SFS data mentioned above show that an insignificant number of the renter households, which make up over two-thirds of all households in need, and few of the owner households in core need (even those at the upper end of the income range) have accumulated sufficient wealth that they could draw on to resolve their housing problems.

The concern that there might be a significant number of asset-rich, income-poor owners swelling the ranks of the “housing needy” is therefore not borne out. Aggregate 2001 Census and 1999 SFS data indicate that, perhaps at most, some 8.1 per cent of owners in core housing need in 2001 possessed home equity and other financial resources that likely could have enabled them to address their own housing affordability problems. Virtually no renter households in core housing need had the financial resources to address their own housing problems. In conclusion, the housing challenge documented by core housing need was very real for close to 1.5 million Canadian households in 2001.

The challenge, though, is not the same for all households in need. Differences in the housing and income circumstances of households in core housing need call for wide-ranging strategies. Moreover, some people have special housing needs that require more than just a housing response. They would require a much more comprehensive continuum of both housing and support services to significantly improve their current circumstances.

¹ Ownership rates are computed as owners divided by total of all tenure types. Census Metropolitan Area data for 1971–1986 are based on 1986 CMA boundaries. All other data for Census Metropolitan Areas have not been adjusted for boundary changes.

² In 1996 and prior years, the Northwest Territories included Nunavut.

Lone parents	216,310	269,220	353,745	433,180	494,645	598,450	576,290
Multiple-family households	24,555	15,095	16,170	16,900	20,340	27,530	38,415
Non-family households	690,290	1,019,825	1,373,355	1,523,145	1,745,785	1,876,725	1,934,860
One person only	510,595	813,865	1,141,935	1,260,065	1,445,450	1,566,635	1,662,845
Two or more persons	179,695	205,960	231,425	263,085	300,330	310,095	272,015

Total household counts for 1986–2001 include households in on-reserve (1986) or band housing (1991, 1996, 2001) and are therefore larger than the sum of owners and renters. Because of changes to the definition of census family, household-type data for 2001 — except for one-person households — is not strictly comparable to data from earlier censuses.

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

These data, from the Census of Canada, apply to all non-farm, non-band, non-reserve private households reporting positive incomes and shelter cost-to-income ratios less than 100 per cent.

Income data collected by the Census of Canada refer to the calendar year preceding the census, while shelter cost data give expenses for the current year. Shelter-cost-to-income ratios are computed directly from these data, that is, by comparing current shelter costs to incomes from the previous year.

Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make-up of the occupying household. The subset of households classified as unable to access acceptable housing is considered to be in core housing need.

Source: CMHC (census-based housing indicators and data).

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

† Shelter cost-to-income ratios in per cent. Income data collected by the Census of Canada refer to the calendar year preceding the census, while shelter cost data give expenses for the current year. Shelter cost-to-income ratios are computed directly from these data, that is, by comparing current shelter costs to incomes from the previous year.

These data, from the Census of Canada, apply to all non-farm, non-band, non-reserve private households reporting positive incomes and shelter cost-to-income ratios less than 100 per cent. Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make up of the occupying household. The subset of households classified as unable to access acceptable housing is considered to be in Core Housing Need.

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

¹ Shelter cost-to-income ratios in per cent. Income data collected by the Census of Canada refer to the calendar year preceding the census, while shelter cost data give expenses for the current year. Shelter-cost-to-income ratios are computed directly from these data, that is, by comparing current shelter costs to incomes from the previous year.

These data, from the Census of Canada, apply to all non-farm, non-band, non-reserve private households reporting positive incomes and shelter cost-to-income ratios less than 100 per cent. Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make up of the occupying household. The subset of households classified as unable to access acceptable housing is considered to be in Core Housing Need.

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

Includes all non-farm, non-band, non-reserve private households with incomes greater than zero and STIRs less than 100%.

Elderly individuals refer to persons 65 years of age or older either living on their own or sharing with other unrelated individuals.

Continued on next page

These data, from the Census of Canada, include all private Aboriginal households.

Definitions

An **Aboriginal family household** is any household in which at least one spouse, common-law partner, or lone parent self-identified as Aboriginal, or at least 50 per cent of household members self-identified as Aboriginal. If any member of the family household identified as Indian (Status or Non-Status), Métis, or Inuit, then the household is classified accordingly. An **Aboriginal non-family household** is any household in which at least 50 per cent of household members self-identified as Aboriginal. If any member of the non-family household identified as Indian (Status or Non-Status), Métis, or Inuit, then the household is classified accordingly. There are cases where two or more identity groups are represented in the same household. For example, a household with one Métis and one Inuit spouse will be counted as both a Métis and as an Inuit household. This approach enables each of the Aboriginal identity groups to be fully counted, but it also means that identity subtotals should not be summed as they will add to more than the total of all Aboriginal households.

Definitions (continued)

On-reserve is used to describe households in Census Subdivisions (CSDs) identified as Indian Reserves, Indian Settlements, Indian Government Districts, Terres réservées, Nisga'a Village, Nisga'a Land, and Teslin Land, as well as specific northern communities selected by Indian and Northern Affairs Canada (INAC) because they are affiliated with First Nations or Indian Bands (for a list of the specific communities and further definitions, see Statistics Canada 2001 Census Dictionary- Geographic Unit: Census Subdivision). In 2001, Census enumeration was incomplete on 30 reserves with an estimated population of 31,000. The 398,400 Aboriginal households in 2001 does not include the estimated count from these missed reserves.

A **Census Metropolitan Area (CMA)** is an area consisting of one or more adjacent municipalities situated around a major urban core with a population of at least 100,000.

The *Canadian Housing Observer* 2005 presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

These data, from the Census of Canada, apply to all non-farm, non-band, non-reserve private households reporting positive incomes and shelter cost-to-income ratios less than 100 percent.

Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make-up of the occupying household. The subset of households classified as unable to access acceptable housing are considered to be in core housing need.

Income data collected by the Census of Canada refer to the calendar year preceding the census, while shelter cost data give expenses for the current year. Shelter cost-to-income ratios are computed directly from these data, that is, by comparing current shelter costs to incomes from the previous year.

Households that live below more than one housing standard are counted in each of the appropriate individual standard subtotals. Counting these households multiple times ensures accurate counts by housing standard; however, housing standard subtotals should not be summed as they will add to more than the total of all households below standards.

For definitions of **Aboriginal households** and **Census Metropolitan Areas (CMAs)**, see the definitions provided with Table 25.

** Estimates of households in core housing need are presented for a specific group (example: renters) where there is a total of at least 100 households in need in the group. All estimates, being derived from data provided by the 1 in 5 sample of households that receive the census long questionnaire, are subject to sampling error.

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

These data, from the Census of Canada, apply to all non-farm, non-band, off-reserve private households reporting positive incomes and shelter cost-to-income ratios less than 100 percent.

Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make-up of the occupying household. The subset of households classified as unable to access acceptable housing are considered to be in core housing need.

Income data collected by the Census of Canada refer to the calendar year preceding the census, while shelter cost data give expenses for the current year. Shelter cost-to-income ratios are computed directly from these data, that is, by comparing current shelter costs to incomes from the previous year.

Households that live below more than one housing standard are counted in each of the appropriate individual standard subtotals. Counting these households multiple times ensures accurate counts by housing standard; however, housing standard subtotals should not be summed as they will add to more than the total of all households below standards.

For definitions of **Aboriginal households** and **Census Metropolitan Areas (CMAs)**, see the definitions provided with Table 25.

** Estimates of households in core housing need are provided for all jurisdictions where there are a total of at least 500 Aboriginal households in housing need. Estimates of households in core housing need are presented for a specific group (example: renters) where there is a total of at least 100 households in need in the group. This rule is relaxed for Prince Edward Island where summary estimates are provided for a total of 105 Aboriginal households in core housing need. All estimates, being derived from data provided by the 1 in 5 sample of households that receive the Census long questionnaire, are subject to sampling error.

The *Canadian Housing Observer 2005* presents revised estimates of core housing need. The core housing need statistics in this year's edition of the *Canadian Housing Observer* replace core housing need statistics in previous editions. See the chapter on "Housing Affordability" for a detailed explanation.

These data, from the Census of Canada, apply to all private Aboriginal households living on-reserve and reporting positive incomes.

On-reserve is used to describe households in Census Subdivisions (CSDs) identified as Indian Reserves, Indian Settlements, Indian Government Districts, Terres réservées, Nisga'a Village, Nisga'a Land, and Teslin Land, as well as specific northern communities selected by Indian and Northern Affairs Canada (INAC) because they are affiliated with First Nations or Indian Bands (for a list of the specific communities and further definitions, see Statistics Canada 2001 Census Dictionary- Geographic Unit: Census Subdivision). In 2001, Census enumeration was incomplete on 30 reserves with an estimated population of 31,000. The 73,265 Aboriginal households living on reserve in 2001 represented in this table does not include the estimated count from these missed reserves.

An **Aboriginal family household** is any household in which at least one spouse, common-law partner, or lone parent self-identified as Aboriginal, or at least 50 per cent of household members self-identified as Aboriginal. If any member of the family household identified as Indian (Status or Non-Status), Métis, or Inuit, then the household is classified accordingly. An

Aboriginal non-family household is any household in which at least 50 per cent of household members self-identified as Aboriginal. If any member of the non-family household identified as Indian (Status or Non-Status), Métis, or Inuit, then the household is classified accordingly. There are cases where two or more identity groups are represented in the same household. For example, a household with one Métis and one Inuit spouse will be counted as both a Métis and as an Inuit household. This approach enables each of the Aboriginal identity groups to be fully counted, but it also means that identity subtotals should not be summed as they will add to more than the total of Aboriginal households.

Acceptable housing is defined as adequate and suitable shelter that can be obtained without spending 30 per cent or more of before-tax household income. Adequate shelter is housing that is not in need of major repair. Suitable shelter is housing that is not crowded, meaning that it has sufficient bedrooms for the size and make-up of the occupying household.

** Numbers of Aboriginal households are presented in all cases where counts exceed at least 25. Estimates of households living below housing standards and unable to access acceptable housing are presented for a specific group (example: renters) where there is a total of at least 100 households in the group. This rule is relaxed for Newfoundland, Prince Edward Island, the Yukon Territory and the Northwest Territories, where summary estimates are provided for each of these jurisdictions. All estimates, being derived from data provided by the 1 in 5 sample of households that receive the census long questionnaire, are subject to sampling error.

**Visit CMHC's website for easy access to timely,
comprehensive data on Canadian housing**

The analysis provided in the *Canadian Housing Observer 2005* is backed by a series of housing data tables that bring a broad range of statistical information together to provide a comprehensive overview of Canadian housing conditions.

Information covering Canada's provinces, territories and major metropolitan housing markets is available on a variety of topics of interest, including the housing stock, demographic and socio-economic influences on housing demand, current housing market developments, housing finance, housing affordability and core housing need.
